# Contents

## Table of Contents

<b>1. Introduction .....</b>	<b>1</b>
1.1 Downloading the Code Samples .....	1
1.2 Feedback .....	2
1.3 Errata .....	2
1.4 Download the eBook .....	2
<b>2. Setting up an Android Studio Development Environment.....</b>	<b>3</b>
2.1 System Requirements.....	3
2.2 Downloading the Android Studio Package .....	3
2.3 Installing Android Studio.....	4
2.3.1 Installation on Windows .....	4
2.3.2 Installation on macOS .....	4
2.3.3 Installation on Linux.....	5
2.4 The Android Studio Setup Wizard.....	5
2.5 Installing Additional Android SDK Packages .....	6
2.6 Making the Android SDK Tools Command-line Accessible.....	8
2.6.1 Windows 7.....	8
2.6.2 Windows 8.1 .....	9
2.6.3 Windows 10 .....	9
2.6.4 Linux .....	10
2.6.5 macOS.....	10
2.7 Android Studio Memory Management .....	10
2.8 Updating Android Studio and the SDK .....	11
2.9 Summary .....	11
<b>3. Creating an Example Android App in Android Studio.....</b>	<b>13</b>
3.1 About the Project .....	13
3.2 Creating a New Android Project.....	13
3.3 Creating an Activity .....	14
3.4 Defining the Project and SDK Settings .....	14
3.5 Modifying the Example Application.....	15
3.6 Reviewing the Layout and Resource Files.....	22
3.7 Adding Interaction.....	25
3.8 Summary .....	26
<b>4. Creating an Android Virtual Device (AVD) in Android Studio .....</b>	<b>27</b>
4.1 About Android Virtual Devices .....	27
4.2 Creating a New AVD .....	28
4.3 Starting the Emulator.....	29
4.4 Running the Application in the AVD .....	29
4.5 Stopping a Running Application .....	31
4.6 Supporting Dark Theme.....	31
4.7 AVD Command-line Creation .....	33
4.8 Android Virtual Device Configuration Files .....	34

## Table of Contents

4.9 Moving and Renaming an Android Virtual Device .....	34
4.10 Summary .....	35
<b>5. Using and Configuring the Android Studio AVD Emulator .....</b>	<b>37</b>
5.1 The Emulator Environment .....	37
5.2 The Emulator Toolbar Options.....	37
5.3 Working in Zoom Mode .....	39
5.4 Resizing the Emulator Window.....	39
5.5 Extended Control Options.....	39
5.5.1 Location.....	39
5.5.2 Cellular .....	40
5.5.3 Camera.....	40
5.5.4 Battery.....	40
5.5.5 Phone .....	40
5.5.6 Directional Pad.....	40
5.5.7 Microphone.....	40
5.5.8 Fingerprint .....	40
5.5.9 Virtual Sensors.....	40
5.5.10 Snapshots.....	40
5.5.11 Record and Playback .....	40
5.5.12 Google Play .....	41
5.5.13 Settings .....	41
5.5.14 Help.....	41
5.6 Working with Snapshots.....	41
5.7 Configuring Fingerprint Emulation .....	42
5.8 Summary .....	43
<b>6. A Tour of the Android Studio User Interface .....</b>	<b>45</b>
6.1 The Welcome Screen.....	45
6.2 The Main Window .....	46
6.3 The Tool Windows .....	47
6.4 Android Studio Keyboard Shortcuts .....	50
6.5 Switcher and Recent Files Navigation .....	50
6.6 Changing the Android Studio Theme .....	51
6.7 Summary .....	51
<b>7. Testing Android Studio Apps on a Physical Android Device.....</b>	<b>53</b>
7.1 An Overview of the Android Debug Bridge (ADB).....	53
7.2 Enabling ADB on Android based Devices.....	53
7.2.1 macOS ADB Configuration.....	54
7.2.2 Windows ADB Configuration.....	55
7.2.3 Linux adb Configuration.....	56
7.3 Testing the adb Connection .....	56
7.4 Summary .....	57
<b>8. The Basics of the Android Studio Code Editor.....</b>	<b>59</b>
8.1 The Android Studio Editor.....	59
8.2 Splitting the Editor Window .....	61
8.3 Code Completion .....	62
8.4 Statement Completion.....	63
8.5 Parameter Information.....	64

8.6 Parameter Name Hints .....	64
8.7 Code Generation .....	64
8.8 Code Folding.....	65
8.9 Quick Documentation Lookup .....	66
8.10 Code Reformatting.....	67
8.11 Finding Sample Code .....	67
8.12 Summary .....	68
<b>9. An Overview of the Android Architecture .....</b>	<b>69</b>
9.1 The Android Software Stack .....	69
9.2 The Linux Kernel.....	70
9.3 Android Runtime – ART.....	70
9.4 Android Libraries.....	70
9.4.1 C/C++ Libraries .....	71
9.5 Application Framework.....	71
9.6 Applications .....	72
9.7 Summary .....	72
<b>10. The Anatomy of an Android Application .....</b>	<b>73</b>
10.1 Android Activities.....	73
10.2 Android Fragments.....	73
10.3 Android Intents .....	74
10.4 Broadcast Intents.....	74
10.5 Broadcast Receivers .....	74
10.6 Android Services.....	74
10.7 Content Providers .....	75
10.8 The Application Manifest .....	75
10.9 Application Resources .....	75
10.10 Application Context.....	75
10.11 Summary .....	75
<b>11. An Introduction to Kotlin.....</b>	<b>77</b>
11.1 What is Kotlin? .....	77
11.2 Kotlin and Java.....	77
11.3 Converting from Java to Kotlin.....	77
11.4 Kotlin and Android Studio .....	78
11.5 Experimenting with Kotlin .....	78
11.6 Semi-colons in Kotlin .....	79
11.7 Summary .....	79
<b>12. Kotlin Data Types, Variables and Nullability .....</b>	<b>81</b>
12.1 Kotlin Data Types.....	81
12.1.1 Integer Data Types .....	82
12.1.2 Floating Point Data Types.....	82
12.1.3 Boolean Data Type.....	82
12.1.4 Character Data Type.....	82
12.1.5 String Data Type.....	82
12.1.6 Escape Sequences .....	83
12.2 Mutable Variables.....	84
12.3 Immutable Variables .....	84
12.4 Declaring Mutable and Immutable Variables.....	84

## Table of Contents

12.5 Data Types are Objects .....	84
12.6 Type Annotations and Type Inference .....	85
12.7 Nullable Type.....	86
12.8 The Safe Call Operator .....	86
12.9 Not-Null Assertion.....	87
12.10 Nullable Types and the let Function.....	87
12.11 Late Initialization (lateinit) .....	88
12.12 The Elvis Operator .....	89
12.13 Type Casting and Type Checking .....	89
12.14 Summary .....	90
<b>13. Kotlin Operators and Expressions .....</b>	<b>91</b>
13.1 Expression Syntax in Kotlin.....	91
13.2 The Basic Assignment Operator.....	91
13.3 Kotlin Arithmetic Operators .....	91
13.4 Augmented Assignment Operators .....	92
13.5 Increment and Decrement Operators .....	92
13.6 Equality Operators .....	93
13.7 Boolean Logical Operators .....	93
13.8 Range Operator .....	94
13.9 Bitwise Operators.....	94
13.9.1 Bitwise Inversion .....	95
13.9.2 Bitwise AND .....	95
13.9.3 Bitwise OR.....	95
13.9.4 Bitwise XOR.....	96
13.9.5 Bitwise Left Shift.....	96
13.9.6 Bitwise Right Shift.....	96
13.10 Summary .....	97
<b>14. Kotlin Flow Control .....</b>	<b>99</b>
14.1 Looping Flow Control .....	99
14.1.1 The Kotlin <i>for-in</i> Statement.....	99
14.1.2 The <i>while</i> Loop .....	100
14.1.3 The <i>do ... while</i> loop .....	101
14.1.4 Breaking from Loops .....	101
14.1.5 The <i>continue</i> Statement .....	102
14.1.6 Break and Continue Labels.....	102
14.2 Conditional Flow Control.....	103
14.2.1 Using the <i>if</i> Expressions .....	103
14.2.2 Using <i>if ... else ...</i> Expressions .....	104
14.2.3 Using <i>if ... else if ...</i> Expressions .....	104
14.2.4 Using the <i>when</i> Statement .....	104
14.3 Summary .....	105
<b>15. An Overview of Kotlin Functions and Lambdas .....</b>	<b>107</b>
15.1 What is a Function? .....	107
15.2 How to Declare a Kotlin Function .....	107
15.3 Calling a Kotlin Function.....	108
15.4 Single Expression Functions .....	108
15.5 Local Functions .....	108
15.6 Handling Return Values.....	109

15.7 Declaring Default Function Parameters.....	109
15.8 Variable Number of Function Parameters .....	109
15.9 Lambda Expressions .....	110
15.10 Higher-order Functions .....	111
15.11 Summary .....	112
<b>16. The Basics of Object Oriented Programming in Kotlin .....</b>	<b>113</b>
16.1 What is an Object? .....	113
16.2 What is a Class? .....	113
16.3 Declaring a Kotlin Class.....	113
16.4 Adding Properties to a Class.....	114
16.5 Defining Methods .....	114
16.6 Declaring and Initializing a Class Instance.....	114
16.7 Primary and Secondary Constructors.....	114
16.8 Initializer Blocks.....	117
16.9 Calling Methods and Accessing Properties .....	117
16.10 Custom Accessors .....	117
16.11 Nested and Inner Classes .....	118
16.12 Companion Objects.....	119
16.13 Summary .....	121
<b>17. An Introduction to Kotlin Inheritance and Subclassing.....</b>	<b>123</b>
17.1 Inheritance, Classes and Subclasses.....	123
17.2 Subclassing Syntax .....	123
17.3 A Kotlin Inheritance Example.....	124
17.4 Extending the Functionality of a Subclass .....	125
17.5 Overriding Inherited Methods.....	126
17.6 Adding a Custom Secondary Constructor.....	127
17.7 Using the SavingsAccount Class .....	127
17.8 Summary .....	127
<b>18. Understanding Android Application and Activity Lifecycles .....</b>	<b>129</b>
18.1 Android Applications and Resource Management.....	129
18.2 Android Process States .....	129
18.2.1 Foreground Process .....	130
18.2.2 Visible Process .....	130
18.2.3 Service Process .....	130
18.2.4 Background Process.....	130
18.2.5 Empty Process .....	131
18.3 Inter-Process Dependencies .....	131
18.4 The Activity Lifecycle.....	131
18.5 The Activity Stack.....	131
18.6 Activity States .....	132
18.7 Configuration Changes .....	132
18.8 Handling State Change.....	133
18.9 Summary .....	133
<b>19. Handling Android Activity State Changes.....</b>	<b>135</b>
19.1 New vs. Old Lifecycle Techniques.....	135
19.2 The Activity and Fragment Classes.....	135
19.3 Dynamic State vs. Persistent State.....	137

## Table of Contents

19.4 The Android Lifecycle Methods.....	138
19.5 Lifetimes .....	139
19.6 Foldable Devices and Multi-Resume .....	140
19.7 Disabling Configuration Change Restarts .....	141
19.8 Lifecycle Method Limitations.....	141
19.9 Summary .....	141
<b>20. Android Activity State Changes by Example .....</b>	<b>143</b>
20.1 Creating the State Change Example Project .....	143
20.2 Designing the User Interface .....	144
20.3 Overriding the Activity Lifecycle Methods .....	144
20.4 Filtering the Logcat Panel.....	147
20.5 Running the Application.....	148
20.6 Experimenting with the Activity.....	149
20.7 Summary .....	150
<b>21. Saving and Restoring the State of an Android Activity .....</b>	<b>151</b>
21.1 Saving Dynamic State .....	151
21.2 Default Saving of User Interface State .....	151
21.3 The Bundle Class .....	152
21.4 Saving the State.....	153
21.5 Restoring the State .....	154
21.6 Testing the Application.....	154
21.7 Summary .....	155
<b>22. Understanding Android Views, View Groups and Layouts .....</b>	<b>157</b>
22.1 Designing for Different Android Devices.....	157
22.2 Views and View Groups .....	157
22.3 Android Layout Managers .....	157
22.4 The View Hierarchy .....	159
22.5 Creating User Interfaces.....	160
22.6 Summary .....	160
<b>23. A Guide to the Android Studio Layout Editor Tool .....</b>	<b>161</b>
23.1 Basic vs. Empty Activity Templates .....	161
23.2 The Android Studio Layout Editor .....	163
23.3 Design Mode.....	163
23.4 The Palette .....	164
23.5 Design and Layout Views.....	165
23.6 Text Mode.....	166
23.7 Setting Attributes.....	167
23.8 Converting Views.....	169
23.9 Displaying Sample Data .....	169
23.10 Creating a Custom Device Definition .....	170
23.11 Changing the Current Device.....	171
23.12 Summary .....	171
<b>24. A Guide to the Android ConstraintLayout.....</b>	<b>173</b>
24.1 How ConstraintLayout Works.....	173
24.1.1 Constraints.....	173
24.1.2 Margins.....	174

24.1.3 Opposing Constraints.....	174
24.1.4 Constraint Bias .....	175
24.1.5 Chains.....	176
24.1.6 Chain Styles.....	176
24.2 Baseline Alignment.....	177
24.3 Working with Guidelines .....	178
24.4 Configuring Widget Dimensions.....	178
24.5 Working with Barriers .....	178
24.6 Ratios .....	180
24.7 ConstraintLayout Advantages .....	180
24.8 ConstraintLayout Availability.....	180
24.9 Summary .....	181
<b>25. A Guide to using ConstraintLayout in Android Studio.....</b>	<b>183</b>
25.1 Design and Layout Views.....	183
25.2 Autoconnect Mode .....	184
25.3 Inference Mode.....	185
25.4 Manipulating Constraints Manually.....	185
25.5 Adding Constraints in the Inspector.....	187
25.6 Viewing Constraints in the Attributes Window.....	187
25.7 Deleting Constraints.....	188
25.8 Adjusting Constraint Bias .....	189
25.9 Understanding ConstraintLayout Margins.....	189
25.10 The Importance of Opposing Constraints and Bias .....	191
25.11 Configuring Widget Dimensions.....	193
25.12 Adding Guidelines .....	194
25.13 Adding Barriers .....	195
25.14 Widget Group Alignment and Distribution.....	197
25.15 Converting other Layouts to ConstraintLayout.....	198
25.16 Summary .....	198
<b>26. Working with ConstraintLayout Chains and Ratios in Android Studio .....</b>	<b>199</b>
26.1 Creating a Chain.....	199
26.2 Changing the Chain Style .....	201
26.3 Spread Inside Chain Style.....	202
26.4 Packed Chain Style.....	202
26.5 Packed Chain Style with Bias.....	202
26.6 Weighted Chain.....	202
26.7 Working with Ratios .....	203
26.8 Summary .....	205
<b>27. An Android Studio Layout Editor ConstraintLayout Tutorial .....</b>	<b>207</b>
27.1 An Android Studio Layout Editor Tool Example .....	207
27.2 Creating a New Activity .....	207
27.3 Preparing the Layout Editor Environment .....	209
27.4 Adding the Widgets to the User Interface.....	210
27.5 Adding the Constraints .....	213
27.6 Testing the Layout .....	214
27.7 Using the Layout Inspector.....	215
27.8 Summary .....	215

## Table of Contents

<b>28. Manual XML Layout Design in Android Studio .....</b>	<b>217</b>
28.1 Manually Creating an XML Layout .....	217
28.2 Manual XML vs. Visual Layout Design.....	220
28.3 Summary .....	220
<b>29. Managing Constraints using Constraint Sets.....</b>	<b>221</b>
29.1 Kotlin Code vs. XML Layout Files.....	221
29.2 Creating Views.....	221
29.3 View Attributes.....	222
29.4 Constraint Sets.....	222
29.4.1 Establishing Connections.....	222
29.4.2 Applying Constraints to a Layout .....	222
29.4.3 Parent Constraint Connections.....	222
29.4.4 Sizing Constraints .....	223
29.4.5 Constraint Bias .....	223
29.4.6 Alignment Constraints.....	223
29.4.7 Copying and Applying Constraint Sets.....	223
29.4.8 ConstraintLayout Chains .....	223
29.4.9 Guidelines .....	224
29.4.10 Removing Constraints.....	224
29.4.11 Scaling.....	224
29.4.12 Rotation.....	225
29.5 Summary .....	225
<b>30. An Android ConstraintSet Tutorial.....</b>	<b>227</b>
30.1 Creating the Example Project in Android Studio .....	227
30.2 Adding Views to an Activity.....	227
30.3 Setting View Attributes.....	228
30.4 Creating View IDs .....	229
30.5 Configuring the Constraint Set .....	230
30.6 Adding the EditText View.....	231
30.7 Converting Density Independent Pixels (dp) to Pixels (px).....	232
30.8 Summary .....	233
<b>31. A Guide to using Apply Changes in Android Studio.....</b>	<b>235</b>
31.1 Introducing Apply Changes .....	235
31.2 Understanding Apply Changes Options .....	235
31.3 Using Apply Changes.....	236
31.4 Configuring Apply Changes Fallback Settings .....	237
31.5 An Apply Changes Tutorial.....	237
31.6 Using Apply Code Changes .....	238
31.7 Using Apply Changes and Restart Activity.....	238
31.8 Using Run App .....	238
31.9 Summary .....	239
<b>32. An Overview and Example of Android Event Handling .....</b>	<b>241</b>
32.1 Understanding Android Events.....	241
32.2 Using the android:onClick Resource .....	241
32.3 Event Listeners and Callback Methods .....	242
32.4 An Event Handling Example .....	242
32.5 Designing the User Interface .....	243

32.6 The Event Listener and Callback Method .....	244
32.7 Consuming Events .....	245
32.8 Summary .....	246
<b>33. Android Touch and Multi-touch Event Handling .....</b>	<b>247</b>
33.1 Intercepting Touch Events .....	247
33.2 The MotionEvent Object .....	248
33.3 Understanding Touch Actions.....	248
33.4 Handling Multiple Touches .....	248
33.5 An Example Multi-Touch Application .....	249
33.6 Designing the Activity User Interface .....	249
33.7 Implementing the Touch Event Listener.....	249
33.8 Running the Example Application.....	252
33.9 Summary .....	252
<b>34. Detecting Common Gestures using the Android Gesture Detector Class.....</b>	<b>253</b>
34.1 Implementing Common Gesture Detection.....	253
34.2 Creating an Example Gesture Detection Project .....	254
34.3 Implementing the Listener Class.....	254
34.4 Creating the GestureDetectorCompat Instance.....	256
34.5 Implementing the onTouchEvent() Method.....	257
34.6 Testing the Application.....	257
34.7 Summary .....	257
<b>35. Implementing Custom Gesture and Pinch Recognition on Android .....</b>	<b>259</b>
35.1 The Android Gesture Builder Application.....	259
35.2 The GestureOverlayView Class .....	259
35.3 Detecting Gestures.....	259
35.4 Identifying Specific Gestures .....	259
35.5 Installing and Running the Gesture Builder Application .....	260
35.6 Creating a Gestures File .....	260
35.7 Creating the Example Project.....	260
35.8 Extracting the Gestures File from the SD Card .....	261
35.9 Adding the Gestures File to the Project .....	261
35.10 Designing the User Interface .....	261
35.11 Loading the Gestures File .....	262
35.12 Registering the Event Listener.....	263
35.13 Implementing the onGesturePerformed Method .....	263
35.14 Testing the Application.....	264
35.15 Configuring the GestureOverlayView.....	264
35.16 Intercepting Gestures.....	265
35.17 Detecting Pinch Gestures.....	265
35.18 A Pinch Gesture Example Project.....	265
35.19 Summary .....	267
<b>36. An Introduction to Android Fragments .....</b>	<b>269</b>
36.1 What is a Fragment? .....	269
36.2 Creating a Fragment .....	269
36.3 Adding a Fragment to an Activity using the Layout XML File .....	270
36.4 Adding and Managing Fragments in Code .....	271
36.5 Handling Fragment Events .....	272

## Table of Contents

36.6 Implementing Fragment Communication.....	273
36.7 Summary .....	274
<b>37. Using Fragments in Android Studio - An Example.....</b>	<b>275</b>
37.1 About the Example Fragment Application .....	275
37.2 Creating the Example Project.....	275
37.3 Creating the First Fragment Layout.....	275
37.4 Creating the First Fragment Class .....	277
37.5 Creating the Second Fragment Layout.....	278
37.6 Adding the Fragments to the Activity .....	280
37.7 Making the Toolbar Fragment Talk to the Activity .....	281
37.8 Making the Activity Talk to the Text Fragment .....	284
37.9 Testing the Application.....	285
37.10 Summary .....	286
<b>38. Modern Android App Architecture with Jetpack.....</b>	<b>287</b>
38.1 What is Android Jetpack? .....	287
38.2 The “Old” Architecture.....	287
38.3 Modern Android Architecture .....	287
38.4 The ViewModel Component .....	288
38.5 The LiveData Component.....	288
38.6 LiveData and Data Binding.....	289
38.7 Android Lifecycles .....	290
38.8 Repository Modules .....	290
38.9 Summary .....	291
<b>39. An Android Jetpack ViewModel Tutorial .....</b>	<b>293</b>
39.1 About the Project .....	293
39.2 Creating the ViewModel Example Project.....	293
39.3 Reviewing the Project.....	293
39.3.1 The Main Activity.....	294
39.3.2 The Content Fragment .....	294
39.3.3 The ViewModel .....	295
39.4 Designing the Fragment Layout.....	295
39.5 Implementing the View Model.....	296
39.6 Associating the Fragment with the View Model.....	297
39.7 Modifying the Fragment .....	297
39.8 Accessing the ViewModel Data.....	298
39.9 Testing the Project.....	298
39.10 Summary .....	299
<b>40. An Android Jetpack LiveData Tutorial .....</b>	<b>301</b>
40.1 LiveData - A Recap .....	301
40.2 Adding LiveData to the ViewModel.....	301
40.3 Implementing the Observer.....	303
40.4 Summary .....	304
<b>41. An Overview of Android Jetpack Data Binding .....</b>	<b>305</b>
41.1 An Overview of Data Binding.....	305
41.2 The Key Components of Data Binding .....	305
41.2.1 The Project Build Configuration .....	305

41.2.2 The Data Binding Layout File.....	306
41.2.3 The Layout File Data Element .....	307
41.2.4 The Binding Classes.....	308
41.2.5 Data Binding Variable Configuration.....	308
41.2.6 Binding Expressions (One-Way).....	309
41.2.7 Binding Expressions (Two-Way).....	310
41.2.8 Event and Listener Bindings.....	310
41.3 Summary .....	311
<b>42. An Android Jetpack Data Binding Tutorial.....</b>	<b>313</b>
42.1 Removing the Redundant Code.....	313
42.2 Enabling Data Binding .....	314
42.3 Adding the Layout Element.....	315
42.4 Adding the Data Element to Layout File.....	316
42.5 Working with the Binding Class .....	317
42.6 Assigning the ViewModel Instance to the Data Binding Variable .....	318
42.7 Adding Binding Expressions .....	318
42.8 Adding the Conversion Method .....	319
42.9 Adding a Listener Binding.....	320
42.10 Testing the App.....	320
42.11 Summary .....	320
<b>43. Working with Android Lifecycle-Aware Components.....</b>	<b>321</b>
43.1 Lifecycle Awareness .....	321
43.2 Lifecycle Owners.....	321
43.3 Lifecycle Observers .....	322
43.4 Lifecycle States and Events.....	322
43.5 Summary .....	324
<b>44. An Android Jetpack Lifecycle Awareness Tutorial .....</b>	<b>325</b>
44.1 Creating the Example Lifecycle Project.....	325
44.2 Creating a Lifecycle Observer.....	325
44.3 Adding the Observer .....	327
44.4 Testing the Observer.....	327
44.5 Creating a Lifecycle Owner.....	328
44.6 Testing the Custom Lifecycle Owner.....	330
44.7 Summary .....	330
<b>45. An Overview of the Navigation Architecture Component.....</b>	<b>331</b>
45.1 Understanding Navigation.....	331
45.2 Declaring a Navigation Host.....	333
45.3 The Navigation Graph .....	334
45.4 Accessing the Navigation Controller.....	335
45.5 Triggering a Navigation Action.....	336
45.6 Passing Arguments.....	336
45.7 Summary .....	337
<b>46. An Android Jetpack Navigation Component Tutorial .....</b>	<b>339</b>
46.1 Creating the NavigationDemo Project.....	339
46.2 Adding Navigation to the Build Configuration.....	339
46.3 Creating the Navigation Graph Resource File.....	340

## Table of Contents

46.4 Declaring a Navigation Host.....	341
46.5 Adding Navigation Destinations.....	343
46.6 Designing the Destination Fragment Layouts.....	345
46.7 Adding an Action to the Navigation Graph.....	346
46.8 Implement the OnFragmentInteractionListener .....	347
46.9 Triggering the Action .....	348
46.10 Passing Data Using Safeargs .....	349
46.11 Summary .....	352
<b>47. Creating and Managing Overflow Menus on Android.....</b>	<b>353</b>
47.1 The Overflow Menu .....	353
47.2 Creating an Overflow Menu .....	353
47.3 Displaying an Overflow Menu.....	354
47.4 Responding to Menu Item Selections.....	355
47.5 Creating Checkable Item Groups.....	355
47.6 Menus and the Android Studio Menu Editor.....	356
47.7 Creating the Example Project .....	357
47.8 Designing the Menu.....	357
47.9 Modifying the onOptionsItemSelected() Method.....	360
47.10 Testing the Application.....	361
47.11 Summary .....	361
<b>48. Animating User Interfaces with the Android Transitions Framework.....</b>	<b>363</b>
48.1 Introducing Android Transitions and Scenes .....	363
48.2 Using Interpolators with Transitions.....	364
48.3 Working with Scene Transitions .....	364
48.4 Custom Transitions and TransitionSets in Code .....	366
48.5 Custom Transitions and TransitionSets in XML.....	366
48.6 Working with Interpolators .....	368
48.7 Creating a Custom Interpolator .....	369
48.8 Using the beginDelayedTransition Method.....	370
48.9 Summary .....	370
<b>49. An Android Transition Tutorial using beginDelayedTransition .....</b>	<b>371</b>
49.1 Creating the Android Studio TransitionDemo Project.....	371
49.2 Preparing the Project Files .....	371
49.3 Implementing beginDelayedTransition Animation .....	371
49.4 Customizing the Transition .....	374
49.5 Summary .....	375
<b>50. Implementing Android Scene Transitions – A Tutorial.....</b>	<b>377</b>
50.1 An Overview of the Scene Transition Project .....	377
50.2 Creating the Android Studio SceneTransitions Project .....	377
50.3 Identifying and Preparing the Root Container .....	377
50.4 Designing the First Scene.....	377
50.5 Designing the Second Scene.....	378
50.6 Entering the First Scene .....	379
50.7 Loading Scene 2.....	380
50.8 Implementing the Transitions .....	380
50.9 Adding the Transition File .....	381
50.10 Loading and Using the Transition Set .....	381

50.11 Configuring Additional Transitions .....	382
50.12 Summary .....	383
<b>51. Working with the Floating Action Button and Snackbar .....</b>	<b>385</b>
51.1 The Material Design.....	385
51.2 The Design Library .....	385
51.3 The Floating Action Button (FAB) .....	385
51.4 The Snackbar.....	386
51.5 Creating the Example Project.....	387
51.6 Reviewing the Project.....	387
51.7 Changing the Floating Action Button .....	388
51.8 Adding the ListView to the Content Layout.....	389
51.9 Adding Items to the ListView .....	390
51.10 Adding an Action to the Snackbar.....	392
51.11 Summary .....	393
<b>52. Creating a Tabbed Interface using the TabLayout Component .....</b>	<b>395</b>
52.1 An Introduction to the ViewPager.....	395
52.2 An Overview of the TabLayout Component .....	395
52.3 Creating the TabLayoutDemo Project.....	396
52.4 Creating the First Fragment.....	396
52.5 Duplicating the Fragments.....	397
52.6 Adding the TabLayout and ViewPager.....	398
52.7 Creating the Pager Adapter.....	399
52.8 Performing the Initialization Tasks.....	400
52.9 Testing the Application.....	402
52.10 Customizing the TabLayout.....	403
52.11 Displaying Icon Tab Items.....	404
52.12 Summary .....	405
<b>53. Working with the RecyclerView and CardView Widgets .....</b>	<b>407</b>
53.1 An Overview of the RecyclerView .....	407
53.2 An Overview of the CardView .....	409
53.3 Summary .....	410
<b>54. An Android RecyclerView and CardView Tutorial .....</b>	<b>411</b>
54.1 Creating the CardDemo Project.....	411
54.2 Removing the Floating Action Button .....	411
54.3 Designing the CardView Layout .....	411
54.4 Adding the RecyclerView.....	413
54.5 Creating the RecyclerView Adapter.....	413
54.6 Adding the Image Files.....	415
54.7 Initializing the RecyclerView Component.....	415
54.8 Testing the Application.....	416
54.9 Responding to Card Selections.....	417
54.10 Summary .....	418
<b>55. A Layout Editor Sample Data Tutorial .....</b>	<b>419</b>
55.1 Adding Sample Data to a Project .....	419
55.2 Using Custom Sample Data .....	423
55.3 Summary .....	426

## Table of Contents

<b>56. Working with the AppBar and Collapsing Toolbar Layouts .....</b>	<b>427</b>
56.1 The Anatomy of an AppBar .....	427
56.2 The Example Project .....	428
56.3 Coordinating the RecyclerView and Toolbar .....	428
56.4 Introducing the Collapsing Toolbar Layout .....	430
56.5 Changing the Title and Scrim Color .....	433
56.6 Summary .....	434
<b>57. An Android Studio Master/Detail Flow Tutorial .....</b>	<b>435</b>
57.1 The Master/Detail Flow .....	435
57.2 Creating a Master/Detail Flow Activity.....	436
57.3 The Anatomy of the Master/Detail Flow Template.....	437
57.4 Modifying the Master/Detail Flow Template .....	438
57.5 Changing the Content Model.....	438
57.6 Changing the Detail Pane .....	440
57.7 Modifying the WebsiteDetailFragment Class.....	441
57.8 Modifying the WebsiteListActivity Class.....	442
57.9 Adding Manifest Permissions.....	443
57.10 Running the Application.....	443
57.11 Summary .....	444
<b>58. An Overview of Android Intents .....</b>	<b>445</b>
58.1 An Overview of Intents .....	445
58.2 Explicit Intents.....	445
58.3 Returning Data from an Activity .....	446
58.4 Implicit Intents .....	447
58.5 Using Intent Filters.....	448
58.6 Checking Intent Availability .....	449
58.7 Summary .....	449
<b>59. Android Explicit Intents – A Worked Example .....</b>	<b>451</b>
59.1 Creating the Explicit Intent Example Application .....	451
59.2 Designing the User Interface Layout for MainActivity .....	451
59.3 Creating the Second Activity Class .....	452
59.4 Designing the User Interface Layout for ActivityB.....	453
59.5 Reviewing the Application Manifest File .....	453
59.6 Creating the Intent .....	454
59.7 Extracting Intent Data .....	455
59.8 Launching ActivityB as a Sub-Activity.....	456
59.9 Returning Data from a Sub-Activity.....	457
59.10 Testing the Application.....	457
59.11 Summary .....	457
<b>60. Android Implicit Intents – A Worked Example .....</b>	<b>459</b>
60.1 Creating the Android Studio Implicit Intent Example Project .....	459
60.2 Designing the User Interface .....	459
60.3 Creating the Implicit Intent .....	460
60.4 Adding a Second Matching Activity .....	460
60.5 Adding the Web View to the UI.....	461
60.6 Obtaining the Intent URL .....	461
60.7 Modifying the MyWebView Project Manifest File .....	462

60.8 Installing the MyWebView Package on a Device.....	464
60.9 Testing the Application.....	464
60.10 Summary .....	465
<b>61. Android Broadcast Intents and Broadcast Receivers .....</b>	<b>467</b>
61.1 An Overview of Broadcast Intents.....	467
61.2 An Overview of Broadcast Receivers .....	468
61.3 Obtaining Results from a Broadcast.....	469
61.4 Sticky Broadcast Intents .....	469
61.5 The Broadcast Intent Example.....	470
61.6 Creating the Example Application .....	470
61.7 Creating and Sending the Broadcast Intent.....	470
61.8 Creating the Broadcast Receiver .....	471
61.9 Registering the Broadcast Receiver.....	472
61.10 Testing the Broadcast Example .....	473
61.11 Listening for System Broadcasts.....	473
61.12 Summary .....	473
<b>62. A Basic Overview of Threads and AsyncTasks.....</b>	<b>475</b>
62.1 An Overview of Threads .....	475
62.2 The Application Main Thread.....	475
62.3 Thread Handlers.....	475
62.4 A Basic AsyncTask Example .....	475
62.5 Subclassing AsyncTask .....	477
62.6 Testing the App.....	480
62.7 Canceling a Task.....	480
62.8 Summary .....	480
<b>63. An Overview of Android Started and Bound Services.....</b>	<b>481</b>
63.1 Started Services.....	481
63.2 Intent Service .....	481
63.3 Bound Service.....	482
63.4 The Anatomy of a Service .....	482
63.5 Controlling Destroyed Service Restart Options.....	483
63.6 Declaring a Service in the Manifest File.....	483
63.7 Starting a Service Running on System Startup.....	484
63.8 Summary .....	484
<b>64. Implementing an Android Started Service – A Worked Example .....</b>	<b>485</b>
64.1 Creating the Example Project .....	485
64.2 Creating the Service Class.....	485
64.3 Adding the Service to the Manifest File .....	486
64.4 Starting the Service .....	487
64.5 Testing the IntentService Example.....	487
64.6 Using the Service Class.....	488
64.7 Creating the New Service.....	488
64.8 Modifying the User Interface.....	489
64.9 Running the Application .....	490
64.10 Creating an AsyncTask for Service Tasks.....	491
64.11 Summary .....	492
<b>65. Android Local Bound Services – A Worked Example.....</b>	<b>493</b>

## Table of Contents

65.1 Understanding Bound Services.....	493
65.2 Bound Service Interaction Options .....	493
65.3 An Android Studio Local Bound Service Example .....	493
65.4 Adding a Bound Service to the Project .....	494
65.5 Implementing the Binder .....	494
65.6 Binding the Client to the Service .....	496
65.7 Completing the Example.....	498
65.8 Testing the Application.....	499
65.9 Summary .....	499
<b>66. Android Remote Bound Services – A Worked Example .....</b>	<b>501</b>
66.1 Client to Remote Service Communication.....	501
66.2 Creating the Example Application.....	501
66.3 Designing the User Interface .....	501
66.4 Implementing the Remote Bound Service.....	502
66.5 Configuring a Remote Service in the Manifest File.....	503
66.6 Launching and Binding to the Remote Service.....	503
66.7 Sending a Message to the Remote Service .....	505
66.8 Summary .....	505
<b>67. An Android Notifications Tutorial .....</b>	<b>507</b>
67.1 An Overview of Notifications.....	507
67.2 Creating the NotifyDemo Project .....	509
67.3 Designing the User Interface .....	509
67.4 Creating the Second Activity .....	509
67.5 Creating a Notification Channel .....	510
67.6 Creating and Issuing a Basic Notification .....	512
67.7 Launching an Activity from a Notification.....	514
67.8 Adding Actions to a Notification .....	516
67.9 Bundled Notifications.....	516
67.10 Summary .....	518
<b>68. An Android Direct Reply Notification Tutorial .....</b>	<b>521</b>
68.1 Creating the DirectReply Project .....	521
68.2 Designing the User Interface .....	521
68.3 Creating the Notification Channel.....	522
68.4 Building the RemoteInput Object.....	523
68.5 Creating the PendingIntent.....	524
68.6 Creating the Reply Action.....	524
68.7 Receiving Direct Reply Input.....	526
68.8 Updating the Notification .....	528
68.9 Summary .....	529
<b>69. Foldable Devices and Multi-Window Support .....</b>	<b>531</b>
69.1 Foldables and Multi-Window Support.....	531
69.2 Using a Foldable Emulator .....	532
69.3 Entering Multi-Window Mode .....	533
69.4 Enabling and using Freeform Support .....	534
69.5 Checking for Freeform Support .....	535
69.6 Enabling Multi-Window Support in an App .....	535
69.7 Specifying Multi-Window Attributes .....	535

69.8 Detecting Multi-Window Mode in an Activity .....	536
69.9 Receiving Multi-Window Notifications .....	536
69.10 Launching an Activity in Multi-Window Mode .....	537
69.11 Configuring Freeform Activity Size and Position.....	538
69.12 Summary .....	538
<b>70. An Overview of Android SQLite Databases .....</b>	<b>539</b>
70.1 Understanding Database Tables .....	539
70.2 Introducing Database Schema .....	539
70.3 Columns and Data Types .....	539
70.4 Database Rows .....	540
70.5 Introducing Primary Keys .....	540
70.6 What is SQLite? .....	540
70.7 Structured Query Language (SQL) .....	540
70.8 Trying SQLite on an Android Virtual Device (AVD) .....	541
70.9 The Android Room Persistence Library.....	543
70.10 Summary .....	543
<b>71. The Android Room Persistence Library .....</b>	<b>545</b>
71.1 Revisiting Modern App Architecture .....	545
71.2 Key Elements of Room Database Persistence.....	545
71.2.1 Repository .....	546
71.2.2 Room Database .....	546
71.2.3 Data Access Object (DAO) .....	546
71.2.4 Entities .....	546
71.2.5 SQLite Database .....	546
71.3 Understanding Entities.....	547
71.4 Data Access Objects .....	549
71.5 The Room Database .....	550
71.6 The Repository.....	551
71.7 In-Memory Databases .....	552
71.8 Summary .....	552
<b>72. An Android TableLayout and TableRow Tutorial .....</b>	<b>553</b>
72.1 The TableLayout and TableRow Layout Views .....	553
72.2 Creating the Room Database Project .....	554
72.3 Converting to a LinearLayout.....	554
72.4 Adding the TableLayout to the User Interface.....	555
72.5 Configuring the TableRows .....	556
72.6 Adding the Button Bar to the Layout .....	557
72.7 Adding the RecyclerView.....	558
72.8 Adjusting the Layout Margins .....	559
72.9 Summary .....	559
<b>73. An Android Room Database and Repository Tutorial.....</b>	<b>561</b>
73.1 About the RoomDemo Project.....	561
73.2 Modifying the Build Configuration.....	561
73.3 Building the Entity .....	561
73.4 Creating the Data Access Object.....	563
73.5 Adding the Room Database .....	564
73.6 Adding the Repository .....	565

## Table of Contents

73.7 Modifying the ViewModel .....	568
73.8 Creating the Product Item Layout .....	569
73.9 Adding the RecyclerView Adapter.....	570
73.10 Preparing the Main Fragment .....	571
73.11 Adding the Button Listeners.....	572
73.12 Adding LiveData Observers .....	572
73.13 Initializing the RecyclerView.....	573
73.14 Testing the RoomDemo App .....	573
73.15 Summary .....	573
<b>74. Accessing Cloud Storage using the Android Storage Access Framework .....</b>	<b>575</b>
74.1 The Storage Access Framework.....	575
74.2 Working with the Storage Access Framework.....	576
74.3 Filtering Picker File Listings .....	576
74.4 Handling Intent Results.....	577
74.5 Reading the Content of a File .....	578
74.6 Writing Content to a File .....	578
74.7 Deleting a File .....	579
74.8 Gaining Persistent Access to a File.....	579
74.9 Summary .....	580
<b>75. An Android Storage Access Framework Example .....</b>	<b>581</b>
75.1 About the Storage Access Framework Example .....	581
75.2 Creating the Storage Access Framework Example.....	581
75.3 Designing the User Interface .....	581
75.4 Declaring Request Codes .....	582
75.5 Creating a New Storage File.....	583
75.6 The onActivityResult() Method .....	584
75.7 Saving to a Storage File.....	585
75.8 Opening and Reading a Storage File .....	587
75.9 Testing the Storage Access Application .....	589
75.10 Summary .....	590
<b>76. Implementing Video Playback on Android using the VideoView and MediaController Classes .....</b>	<b>591</b>
76.1 Introducing the Android VideoView Class .....	591
76.2 Introducing the Android MediaController Class .....	592
76.3 Creating the Video Playback Example .....	592
76.4 Designing the VideoPlayer Layout .....	592
76.5 Configuring the VideoView.....	593
76.6 Adding Internet Permission .....	594
76.7 Adding the MediaController to the Video View.....	595
76.8 Setting up the onPreparedListener .....	595
76.9 Summary .....	596
<b>77. Android Picture-in-Picture Mode.....</b>	<b>597</b>
77.1 Picture-in-Picture Features .....	597
77.2 Enabling Picture-in-Picture Mode.....	598
77.3 Configuring Picture-in-Picture Parameters .....	598
77.4 Entering Picture-in-Picture Mode .....	599
77.5 Detecting Picture-in-Picture Mode Changes .....	599
77.6 Adding Picture-in-Picture Actions .....	599

77.7 Summary .....	600
<b>78. An Android Picture-in-Picture Tutorial.....</b>	<b>601</b>
78.1 Adding Picture-in-Picture Support to the Manifest.....	601
78.2 Adding a Picture-in-Picture Button .....	601
78.3 Entering Picture-in-Picture Mode .....	601
78.4 Detecting Picture-in-Picture Mode Changes .....	603
78.5 Adding a Broadcast Receiver .....	604
78.6 Adding the PiP Action.....	605
78.7 Testing the Picture-in-Picture Action .....	607
78.8 Summary .....	608
<b>79. Making Runtime Permission Requests in Android.....</b>	<b>609</b>
79.1 Understanding Normal and Dangerous Permissions.....	609
79.2 Creating the Permissions Example Project.....	611
79.3 Checking for a Permission .....	611
79.4 Requesting Permission at Runtime.....	613
79.5 Providing a Rationale for the Permission Request .....	614
79.6 Testing the Permissions App.....	616
79.7 Summary .....	616
<b>80. Android Audio Recording and Playback using MediaPlayer and MediaRecorder .....</b>	<b>617</b>
80.1 Playing Audio .....	617
80.2 Recording Audio and Video using the MediaRecorder Class .....	618
80.3 About the Example Project .....	619
80.4 Creating the AudioApp Project.....	619
80.5 Designing the User Interface .....	619
80.6 Checking for Microphone Availability.....	620
80.7 Performing the Activity Initialization .....	621
80.8 Implementing the recordAudio() Method.....	622
80.9 Implementing the stopAudio() Method.....	622
80.10 Implementing the playAudio() method.....	623
80.11 Configuring and Requesting Permissions .....	623
80.12 Testing the Application.....	626
80.13 Summary .....	626
<b>81. Working with the Google Maps Android API in Android Studio .....</b>	<b>627</b>
81.1 The Elements of the Google Maps Android API .....	627
81.2 Creating the Google Maps Project.....	628
81.3 Obtaining Your Developer Signature .....	628
81.4 Adding the Apache HTTP Legacy Library Requirement .....	629
81.5 Testing the Application.....	629
81.6 Understanding Geocoding and Reverse Geocoding .....	630
81.7 Adding a Map to an Application .....	631
81.8 Requesting Current Location Permission.....	632
81.9 Displaying the User's Current Location .....	633
81.10 Changing the Map Type.....	634
81.11 Displaying Map Controls to the User.....	635
81.12 Handling Map Gesture Interaction.....	635
81.12.1 Map Zooming Gestures.....	635
81.12.2 Map Scrolling/Panning Gestures .....	636

## Table of Contents

81.12.3 Map Tilt Gestures.....	636
81.12.4 Map Rotation Gestures.....	636
81.13 Creating Map Markers.....	636
81.14 Controlling the Map Camera .....	637
81.15 Summary .....	639
<b>82. Printing with the Android Printing Framework .....</b>	<b>641</b>
82.1 The Android Printing Architecture .....	641
82.2 The Print Service Plugins .....	641
82.3 Google Cloud Print.....	642
82.4 Printing to Google Drive.....	642
82.5 Save as PDF .....	643
82.6 Printing from Android Devices .....	643
82.7 Options for Building Print Support into Android Apps.....	644
82.7.1 Image Printing.....	644
82.7.2 Creating and Printing HTML Content .....	645
82.7.3 Printing a Web Page.....	646
82.7.4 Printing a Custom Document .....	647
82.8 Summary .....	647
<b>83. An Android HTML and Web Content Printing Example .....</b>	<b>649</b>
83.1 Creating the HTML Printing Example Application .....	649
83.2 Printing Dynamic HTML Content .....	649
83.3 Creating the Web Page Printing Example.....	652
83.4 Removing the Floating Action Button .....	652
83.5 Designing the User Interface Layout .....	652
83.6 Loading the Web Page into the WebView.....	653
83.7 Adding the Print Menu Option.....	654
83.8 Summary .....	656
<b>84. A Guide to Android Custom Document Printing.....</b>	<b>657</b>
84.1 An Overview of Android Custom Document Printing .....	657
84.1.1 Custom Print Adapters.....	657
84.2 Preparing the Custom Document Printing Project.....	658
84.3 Creating the Custom Print Adapter.....	659
84.4 Implementing the onLayout() Callback Method .....	660
84.5 Implementing the onWrite() Callback Method .....	663
84.6 Checking a Page is in Range .....	665
84.7 Drawing the Content on the Page Canvas .....	666
84.8 Starting the Print Job .....	668
84.9 Testing the Application.....	669
84.10 Summary .....	669
<b>85. An Introduction to Android App Links.....</b>	<b>671</b>
85.1 An Overview of Android App Links .....	671
85.2 App Link Intent Filters .....	671

# Chapter 1

## 1. Introduction

In 2018 Google introduced Android Jetpack to the developer community. Designed to make it quicker and easier to develop modern and reliable Android apps, Jetpack consists of a set of tools, libraries and architectural guidelines. The main elements of Android Jetpack consist of the Android Studio Integrated Development Environment (IDE), the Android Architecture Components and the Modern App Architecture Guidelines, all of which are covered in this latest edition of *Android Studio Development Essentials*.

Fully updated for Android Studio 3.5 and Android 10 (Q), the goal of this book is to teach the skills necessary to develop Android based applications using the Kotlin programming language.

Beginning with the basics, this book provides an outline of the steps necessary to set up an Android development and testing environment followed by an introduction to programming in Kotlin including data types, flow control, functions, lambdas and object-oriented programming.

An overview of Android Studio is included covering areas such as tool windows, the code editor and the Layout Editor tool. An introduction to the architecture of Android is followed by an in-depth look at the design of Android applications and user interfaces using the Android Studio environment.

Chapters are also included covering the Android Architecture Components including view models, lifecycle management, Room database access, app navigation, live data and data binding.

More advanced topics such as intents are also covered, as are touch screen handling, gesture recognition, and the recording and playback of audio. This edition of the book also covers printing, transitions, cloud-based file storage and foldable device support.

The concepts of material design are also covered in detail, including the use of floating action buttons, Snackbars, tabbed interfaces, card views, navigation drawers and collapsing toolbars.

In addition to covering general Android development techniques, the book also includes Google Play specific topics such as implementing maps using the Google Maps Android API, and submitting apps to the Google Play Developer Console.

Other key features of Android Studio 3.5 and Android 10 are also covered in detail including the Layout Editor, the ConstraintLayout and ConstraintSet classes, constraint chains and barriers and direct reply notifications.

Chapters also cover advanced features of Android Studio such as App Links, Dynamic Delivery, the Android Studio Profiler and Gradle build configuration.

Assuming you already have some programming experience, are ready to download Android Studio and the Android SDK, have access to a Windows, Mac or Linux system and ideas for some apps to develop, you are ready to get started.

### 1.1 Downloading the Code Samples

The source code and Android Studio project files for the examples contained in this book are available for download at:

<https://www.ebookfrenzy.com/retail/as35kotlin/index.php>

## Introduction

The steps to load a project from the code samples into Android Studio are as follows:

1. From the Welcome to Android Studio dialog, select the Open an existing Android Studio project option.
2. In the project selection dialog, navigate to and select the folder containing the project to be imported and click on OK.

## 1.2 Feedback

We want you to be satisfied with your purchase of this book. If you find any errors in the book, or have any comments, questions or concerns please contact us at [feedback@ebookfrenzy.com](mailto:feedback@ebookfrenzy.com).

## 1.3 Errata

While we make every effort to ensure the accuracy of the content of this book, it is inevitable that a book covering a subject area of this size and complexity may include some errors and oversights. Any known issues with the book will be outlined, together with solutions, at the following URL:

<https://www.ebookfrenzy.com/errata/as35kotlin.html>

In the event that you find an error not listed in the errata, please let us know by emailing our technical support team at [feedback@ebookfrenzy.com](mailto:feedback@ebookfrenzy.com). They are there to help you and will work to resolve any problems you may encounter.

## 1.4 Download the eBook

Thank you for purchasing the print edition of this book. If you would like to download the PDF version of this book, please email proof of purchase (for example a receipt, delivery notice or photo of the physical book) to [feedback@ebookfrenzy.com](mailto:feedback@ebookfrenzy.com) and we will provide you with a download link for the book in PDF format.

## 2. Setting up an Android Studio Development Environment

Before any work can begin on the development of an Android application, the first step is to configure a computer system to act as the development platform. This involves a number of steps consisting of installing the Android Studio Integrated Development Environment (IDE) which also includes the Android Software Development Kit (SDK), the Kotlin plug-in and OpenJDK Java development environment.

This chapter will cover the steps necessary to install the requisite components for Android application development on Windows, macOS and Linux based systems.

### 2.1 System Requirements

Android application development may be performed on any of the following system types:

- Windows 7/8/10 (32-bit or 64-bit though the Android emulator will only run on 64-bit systems)
- macOS 10.10 or later (Intel based systems only)
- ChromeOS device with Intel i5 or higher and minimum 8GB of RAM
- Linux systems with version 2.19 or later of GNU C Library (glibc)
- Minimum of 4GB of RAM (8GB is preferred)
- Approximately 4GB of available disk space
- 1280 x 800 minimum screen resolution

### 2.2 Downloading the Android Studio Package

Most of the work involved in developing applications for Android will be performed using the Android Studio environment. The content and examples in this book were created based on Android Studio version 3.5 using the Android 10.0 (Q) API 29 SDK which, at the time writing are the current versions.

Android Studio is, however, subject to frequent updates so a newer version may have been released since this book was published.

The latest release of Android Studio may be downloaded from the primary download page which can be found at the following URL:

<https://developer.android.com/studio/index.html>

If this page provides instructions for downloading a newer version of Android Studio it is important to note that there may be some minor differences between this book and the software. A web search for Android Studio 3.5 should provide the option to download the older version in the event that these differences become a problem. Alternatively, visit the following web page to find Android Studio 3.5 in the archives:

<https://developer.android.com/studio/archive>

## 2.3 Installing Android Studio

Once downloaded, the exact steps to install Android Studio differ depending on the operating system on which the installation is being performed.

### 2.3.1 Installation on Windows

Locate the downloaded Android Studio installation executable file (named *android-studio-ide-<version>-windows.exe*) in a Windows Explorer window and double-click on it to start the installation process, clicking the Yes button in the User Account Control dialog if it appears.

Once the Android Studio setup wizard appears, work through the various screens to configure the installation to meet your requirements in terms of the file system location into which Android Studio should be installed and whether or not it should be made available to other users of the system. When prompted to select the components to install, make sure that the *Android Studio* and *Android Virtual Device* options are all selected.

Although there are no strict rules on where Android Studio should be installed on the system, the remainder of this book will assume that the installation was performed into *C:\Program Files\Android\Android Studio* and that the Android SDK packages have been installed into the user's *AppData\Local\Android\sdk* sub-folder. Once the options have been configured, click on the *Install* button to begin the installation process.

On versions of Windows with a Start menu, the newly installed Android Studio can be launched from the entry added to that menu during the installation. The executable may be pinned to the task bar for easy access by navigating to the *Android Studio\bin* directory, right-clicking on the executable and selecting the *Pin to Taskbar* menu option. Note that the executable is provided in 32-bit (*studio*) and 64-bit (*studio64*) executable versions. If you are running a 32-bit system be sure to use the *studio* executable.

### 2.3.2 Installation on macOS

Android Studio for macOS is downloaded in the form of a disk image (.dmg) file. Once the *android-studio-ide-<version>-mac.dmg* file has been downloaded, locate it in a Finder window and double-click on it to open it as shown in Figure 2-1:

Figure 2-1

To install the package, simply drag the Android Studio icon and drop it onto the Applications folder. The Android Studio package will then be installed into the Applications folder of the system, a process which will typically take a few minutes to complete.

To launch Android Studio, locate the executable in the Applications folder using a Finder window and double-click on it.

For future easier access to the tool, drag the Android Studio icon from the Finder window and drop it onto the

dock.

### 2.3.3 Installation on Linux

Having downloaded the Linux Android Studio package, open a terminal window, change directory to the location where Android Studio is to be installed and execute the following command:

```
unzip <path to package>/android-studio-ide-<version>-linux.zip
```

Note that the Android Studio bundle will be installed into a sub-directory named *android-studio*. Assuming, therefore, that the above command was executed in */home/demo*, the software packages will be unpacked into */home/demo/android-studio*.

To launch Android Studio, open a terminal window, change directory to the *android-studio/bin* sub-directory and execute the following command:

```
./studio.sh
```

When running on a 64-bit Linux system, it will be necessary to install some 32-bit support libraries before Android Studio will run. On Ubuntu these libraries can be installed using the following command:

```
sudo apt-get install libc6:i386 libncurses5:i386 libstdc++6:i386 lib32z1 libbz2-1.0:i386
```

On Red Hat and Fedora based 64-bit systems, use the following command:

```
sudo yum install zlib.i686 ncurses-libs.i686 bzip2-libs.i686
```

## 2.4 The Android Studio Setup Wizard

The first time that Android Studio is launched after being installed, a dialog will appear providing the option to import settings from a previous Android Studio version. If you have settings from a previous version and would like to import them into the latest installation, select the appropriate option and location. Alternatively, indicate that you do not need to import any previous settings and click on the OK button to proceed.

Next, the setup wizard may appear as shown in Figure 2-2 though this dialog does not appear on all platforms:

Figure 2-2

If the wizard appears, click on the Next button, choose the Standard installation option and click on Next once again.

Android Studio will proceed to download and configure the latest Android SDK and some additional components

## Setting up an Android Studio Development Environment

and packages. Once this process has completed, click on the *Finish* button in the *Downloading Components* dialog at which point the Welcome to Android Studio screen should then appear:

Figure 2-3

## 2.5 Installing Additional Android SDK Packages

The steps performed so far have installed Java, the Android Studio IDE and the current set of default Android SDK packages. Before proceeding, it is worth taking some time to verify which packages are installed and to install any missing or updated packages.

This task can be performed using the *Android SDK Settings* screen, which may be launched from within the Android Studio tool by selecting the *Configure -> SDK Manager* option from within the Android Studio welcome dialog. Once invoked, the *Android SDK* screen of the default settings dialog will appear as shown in Figure 2-4:

Figure 2-4

Immediately after installing Android Studio for the first time it is likely that only the latest released version of the Android SDK has been installed. To install older versions of the Android SDK simply select the checkboxes corresponding to the versions and click on the *Apply* button.

It is also possible that updates will be listed as being available for the latest SDK. To access detailed information about the packages that are available for update, enable the *Show Package Details* option located in the lower

right-hand corner of the screen. This will display information similar to that shown in Figure 2-5:

Name	API Level	Revision	Status
Android TV Intel x86 Atom System Image	25	6	Not installed
Android Wear for China ARM EABI v7a System Image	25	3	Not installed
Android Wear for China Intel x86 Atom System Image	25	3	Not installed
Android Wear ARM EABI v7a System Image	25	3	Not installed
Android Wear Intel x86 Atom System Image	25	8	Not installed
Google APIs ARM 64 v8a System Image	25	8	Not installed
Google APIs ARM EABI v7a System Image	25	8	Not installed
Google APIs Intel x86 Atom System Image	25	8	Not installed
Google APIs Intel x86 Atom_64 System Image	25	6	Update Available: 8
Android 7.0 (Nougat)			
Google APIs	24	1	Not installed

Figure 2-5

The above figure highlights the availability of an update. To install the updates, enable the checkbox to the left of the item name and click on the *Apply* button.

In addition to the Android SDK packages, a number of tools are also installed for building Android applications. To view the currently installed packages and check for updates, remain within the SDK settings screen and select the SDK Tools tab as shown in Figure 2-6:

Figure 2-6

Within the Android SDK Tools screen, make sure that the following packages are listed as *Installed* in the Status column:

- Android SDK Build-tools
- Android Emulator
- Android SDK Platform-tools
- Android SDK Tools
- Google Play Services
- Intel x86 Emulator Accelerator (HAXM installer)
- Google USB Driver (Windows only)

## Setting up an Android Studio Development Environment

In the event that any of the above packages are listed as *Not Installed* or requiring an update, simply select the checkboxes next to those packages and click on the *Apply* button to initiate the installation process.

Once the installation is complete, review the package list and make sure that the selected packages are now listed as *Installed* in the *Status* column. If any are listed as *Not installed*, make sure they are selected and click on the *Apply* button again.

## 2.6 Making the Android SDK Tools Command-line Accessible

Most of the time, the underlying tools of the Android SDK will be accessed from within the Android Studio environment. That being said, however, there will also be instances where it will be useful to be able to invoke those tools from a command prompt or terminal window. In order for the operating system on which you are developing to be able to find these tools, it will be necessary to add them to the system's *PATH* environment variable.

Regardless of operating system, the *PATH* variable needs to be configured to include the following paths (where *<path\_to\_android\_sdk\_installation>* represents the file system location into which the Android SDK was installed):

```
<path_to_android_sdk_installation>/sdk/tools  
<path_to_android_sdk_installation>/sdk/tools/bin  
<path_to_android_sdk_installation>/sdk/platform-tools
```

The location of the SDK on your system can be identified by launching the SDK Manager and referring to the *Android SDK Location:* field located at the top of the settings panel as highlighted in Figure 2-7:

Figure 2-7

Once the location of the SDK has been identified, the steps to add this to the *PATH* variable are operating system dependent:

### 2.6.1 Windows 7

1. Right-click on Computer in the desktop start menu and select Properties from the resulting menu.
2. In the properties panel, select the Advanced System Settings link and, in the resulting dialog, click on the Environment Variables... button.
3. In the Environment Variables dialog, locate the Path variable in the System variables list, select it and click on *Edit...*. Locate the end of the current variable value string and append the path to the Android platform tools to the end, using a semicolon to separate the path from the preceding values. For example, assuming the Android SDK was installed into C:\Users\demo\AppData\Local\Android\sdk, the following would be appended to the end of the current Path value:

```
;C:\Users\demo\AppData\Local\Android\sdk\platform-tools; C:\Users\demo\AppData\Local\Android\sdk\tools; C:\Users\demo\AppData\Local\Android\sdk\tools\bin
```

4. Click on OK in each dialog box and close the system properties control panel.

Once the above steps are complete, verify that the path is correctly set by opening a *Command Prompt* window (*Start -> All Programs -> Accessories -> Command Prompt*) and at the prompt enter:

```
echo %Path%
```

The returned path variable value should include the paths to the Android SDK platform tools folders. Verify that the *platform-tools* value is correct by attempting to run the *adb* tool as follows:

```
adb
```

The tool should output a list of command line options when executed.

Similarly, check the *tools* path setting by attempting to launch the AVD Manager command line tool (don't worry if the *avdmanager* tool reports a problem with Java - this will be addressed later):

```
avdmanager
```

In the event that a message similar to the following message appears for one or both of the commands, it is most likely that an incorrect path was appended to the Path environment variable:

```
'adb' is not recognized as an internal or external command,  
operable program or batch file.
```

## 2.6.2 Windows 8.1

1. On the start screen, move the mouse to the bottom right-hand corner of the screen and select Search from the resulting menu. In the search box, enter Control Panel. When the Control Panel icon appears in the results area, click on it to launch the tool on the desktop.
2. Within the Control Panel, use the Category menu to change the display to Large Icons. From the list of icons select the one labeled System.
3. Follow the steps outlined for Windows 7 starting from step 2 through to step 4.

Open the command prompt window (move the mouse to the bottom right-hand corner of the screen, select the Search option and enter *cmd* into the search box). Select *Command Prompt* from the search results.

Within the Command Prompt window, enter:

```
echo %Path%
```

The returned path variable value should include the paths to the Android SDK platform tools folders. Verify that the *platform-tools* value is correct by attempting to run the *adb* tool as follows:

```
adb
```

The tool should output a list of command line options when executed.

Similarly, check the *tools* path setting by attempting to run the AVD Manager command line tool (don't worry if the *avdmanager* tool reports a problem with Java - this will be addressed later):

```
avdmanager
```

In the event that a message similar to the following message appears for one or both of the commands, it is most likely that an incorrect path was appended to the Path environment variable:

```
'adb' is not recognized as an internal or external command,  
operable program or batch file.
```

## 2.6.3 Windows 10

Right-click on the Start menu, select Settings from the resulting menu and enter "Edit the system environment variables" into the Find a setting text field. In the System Properties dialog, click the *Environment Variables...*

## Setting up an Android Studio Development Environment

button. Follow the steps outlined for Windows 7 starting from step 3.

### 2.6.4 Linux

On Linux, this configuration can typically be achieved by adding a command to the `.bashrc` file in your home directory (specifics may differ depending on the particular Linux distribution in use). Assuming that the Android SDK bundle package was installed into `/home/demo/Android/sdk`, the export line in the `.bashrc` file would read as follows:

```
export PATH=/home/demo/Android/sdk/platform-tools:/home/demo/Android/sdk/tools:/home/demo/Android/sdk/tools/bin:/home/demo/android-studio/bin:$PATH
```

Note also that the above command adds the `android-studio/bin` directory to the PATH variable. This will enable the `studio.sh` script to be executed regardless of the current directory within a terminal window.

### 2.6.5 macOS

A number of techniques may be employed to modify the `$PATH` environment variable on macOS. Arguably the cleanest method is to add a new file in the `/etc/paths.d` directory containing the paths to be added to `$PATH`. Assuming an Android SDK installation location of `/Users/demo/Library/Android/sdk`, the path may be configured by creating a new file named `android-sdk` in the `/etc/paths.d` directory containing the following lines:

```
/Users/demo/Library/Android/tools  
/Users/demo/Library/Android/tools/bin  
/Users/demo/Library/Android/sdk/platform-tools
```

Note that since this is a system directory it will be necessary to use the `sudo` command when creating the file.

For example:

```
sudo vi /etc/paths.d/android-sdk
```

## 2.7 Android Studio Memory Management

Android Studio is a large and complex software application that consists of many background processes. Although Android Studio has been criticized in the past for providing less than optimal performance, Google has made significant performance improvements in recent releases and continues to do so with each new version. Part of these improvements include allowing the user to configure the amount of memory used by both the Android Studio IDE and the background processes used to build and run apps. This allows the software to take advantage of systems with larger amounts of RAM.

If you are running Android Studio on a system with sufficient unused RAM to increase these values (this feature is only available on 64-bit systems with 5GB or more of RAM) and find that Android Studio performance appears to be degraded it may be worth experimenting with these memory settings. Android Studio may also notify you that performance can be increased via a dialog similar to the one shown below:

Figure 2-8

To view and modify the current memory configuration, select the `File -> Settings...` (`Android Studio -> Preferences...` on macOS) menu option and, in the resulting dialog, select the `Memory Settings` option listed under `System Settings` in the left-hand navigation panel as illustrated in Figure 2-9 below.

When changing the memory allocation, be sure not to allocate more memory than necessary or than your

system can spare without slowing down other processes.

Figure 2-9

## 2.8 Updating Android Studio and the SDK

From time to time new versions of Android Studio and the Android SDK are released. New versions of the SDK are installed using the Android SDK Manager. Android Studio will typically notify you when an update is ready to be installed.

To manually check for Android Studio updates, click on the *Configure -> Check for Updates* menu option within the Android Studio welcome screen, or use the *Help -> Check for Updates...* (*Android Studio -> Check for Updates...* on macOS) menu option accessible from within the Android Studio main window.

## 2.9 Summary

Prior to beginning the development of Android based applications, the first step is to set up a suitable development environment. This consists of the Android SDKs and Android Studio IDE (which also includes the OpenJDK development environment). In this chapter, we have covered the steps necessary to install these packages on Windows, macOS and Linux.

## 3. Creating an Example Android App in Android Studio

The preceding chapters of this book have covered the steps necessary to configure an environment suitable for the development of Android applications using the Android Studio IDE. Before moving on to slightly more advanced topics, now is a good time to validate that all of the required development packages are installed and functioning correctly. The best way to achieve this goal is to create an Android application and compile and run it. This chapter will cover the creation of a simple Android application project using Android Studio. Once the project has been created, a later chapter will explore the use of the Android emulator environment to perform a test run of the application.

### 3.1 About the Project

The project created in this chapter takes the form of a very simple currency conversion calculator (so simple, in fact, that it only converts from dollars to euros and does so using an estimated conversion rate). The project will also make use of the most basic of Android Studio project templates. This simplicity allows us to introduce some of the key aspects of Android app development without overwhelming the beginner by trying to introduce too many concepts, such as the recommended app architecture and Android architecture components, at once. When following the tutorial in this chapter, rest assured that all of the techniques and code used in this initial example project will be covered in much greater detail in later chapters.

### 3.2 Creating a New Android Project

The first step in the application development process is to create a new project within the Android Studio environment. Begin, therefore, by launching Android Studio so that the “Welcome to Android Studio” screen appears as illustrated in Figure 3-1:

Figure 3-1

## Creating an Example Android App in Android Studio

Once this window appears, Android Studio is ready for a new project to be created. To create the new project, simply click on the *Start a new Android Studio project* option to display the first screen of the *New Project* wizard.

### 3.3 Creating an Activity

The first step is to define the type of initial activity that is to be created for the application. Options are available to create projects for Phone and Tablet, Wear OS, TV, Android Auto or Android Things. A range of different activity types is available when developing Android applications, many of which will be covered extensively in later chapters. For the purposes of this example, however, simply select the option to create a *Basic Activity* on the Phone and Tablet screen. The Basic Activity option creates a template user interface consisting of an app bar, menu, content area and a single floating action button.

Figure 3-2

With the Basic Activity option selected, click *Next* to continue with the project configuration.

### 3.4 Defining the Project and SDK Settings

In the project configuration window (Figure 3-3), set the *Name* field to *AndroidSample*. The application name is the name by which the application will be referenced and identified within Android Studio and is also the name that would be used if the completed application were to go on sale in the Google Play store.

The *Package name* is used to uniquely identify the application within the Android application ecosystem. Although this can be set to any string that uniquely identifies your app, it is traditionally based on the reversed URL of your domain name followed by the name of the application. For example, if your domain is *www.mycompany.com*, and the application has been named *AndroidSample*, then the package name might be specified as follows:

```
com.mycompany.androidsample
```

If you do not have a domain name you can enter any other string into the Company Domain field, or you may use *example.com* for the purposes of testing, though this will need to be changed before an application can be published:

```
com.example.androidsample
```

The *Save location* setting will default to a location in the folder named *AndroidStudioProjects* located in your home directory and may be changed by clicking on the folder icon to the right of the text field containing the current path setting.

Set the minimum SDK setting to API 26: Android 8.0 (Oreo). This is the SDK that will be used in most of the projects created in this book unless a necessary feature is only available in a more recent version.

Figure 3-3

Finally, change the *Language* menu to *Kotlin* and click on *Finish* to initiate the project creation process.

### 3.5 Modifying the Example Application

At this point, Android Studio has created a minimal example application project and opened the main window.

Figure 3-4

The newly created project and references to associated files are listed in the *Project* tool window located on the left-hand side of the main project window. The *Project* tool window has a number of modes in which information can be displayed. By default, this panel will be in *Android* mode. This setting is controlled by the menu at the top of the panel as highlighted in Figure 3-5. If the panel is not currently in *Android* mode, use the menu to switch mode:

## Creating an Example Android App in Android Studio

Figure 3-5

The example project created for us when we selected the option to create an activity consists of a user interface containing a label that will read “Hello World!” when the application is executed.

The next step in this tutorial is to modify the user interface of our application so that it displays a larger text view object with a different message to the one provided for us by Android Studio.

The user interface design for our activity is stored in a file named *activity\_main.xml* which, in turn, is located under *app -> res -> layout* in the project file hierarchy. This layout file includes the app bar (also known as an action bar) that appears across the top of the device screen (marked A in Figure 3-6) and the floating action button (the email button marked B). In addition to these items, the *activity\_main.xml* layout file contains a reference to a second file containing the content layout (marked C):

Figure 3-6

By default, the content layout is contained within a file named *content\_main.xml* and it is within this file that changes to the layout of the activity are made. Using the Project tool window, locate this file as illustrated in Figure 3-7:

Figure 3-7

Once located, double-click on the file to load it into the user interface Layout Editor tool which will appear in the center panel of the Android Studio main window:

Figure 3-8

In the toolbar across the top of the Layout Editor window is a menu (currently set to *Pixel* in the above figure) which is reflected in the visual representation of the device within the Layout Editor panel. A wide range of other device options are available for selection by clicking on this menu.

To change the orientation of the device representation between landscape and portrait simply use the drop down menu immediately to the left of the device selection menu showing the icon.

As can be seen in the device screen, the content layout already includes a label that displays a "Hello World!" message. Running down the left-hand side of the panel is a palette containing different categories of user interface components that may be used to construct a user interface, such as buttons, labels and text fields. It should be noted, however, that not all user interface components are obviously visible to the user. One such category consists of *layouts*. Android supports a variety of layouts that provide different levels of control over how visual user interface components are positioned and managed on the screen. Though it is difficult to tell from looking at the visual representation of the user interface, the current design has been created using a *ConstraintLayout*. This can be confirmed by reviewing the information in the *Component Tree* panel which, by default, is located

## Creating an Example Android App in Android Studio

in the lower left-hand corner of the Layout Editor panel and is shown in Figure 3-9:

Figure 3-9

As we can see from the component tree hierarchy, the user interface layout consists of a ConstraintLayout parent with a single child in the form of a TextView object.

Before proceeding, check that the Layout Editor's Autoconnect mode is enabled. This means that as components are added to the layout, the Layout Editor will automatically add constraints to make sure the components are correctly positioned for different screen sizes and device orientations (a topic that will be covered in much greater detail in future chapters). The Autoconnect button appears in the Layout Editor toolbar and is represented by a magnet icon. When disabled the magnet appears with a diagonal line through it (Figure 3-10). If necessary, re-enable Autoconnect mode by clicking on this button.

Figure 3-10

The next step in modifying the application is to add some additional components to the layout, the first of which will be a Button for the user to press to initiate the currency conversion.

The Palette panel consists of two columns with the left-hand column containing a list of view component categories. The right-hand column lists the components contained within the currently selected category. In Figure 3-11, for example, the Button view is currently selected within the Buttons category:

Figure 3-11

Click and drag the *Button* object from the Buttons list and drop it in the horizontal center of the user interface design so that it is positioned beneath the existing TextView widget:

Figure 3-12

The next step is to change the text that is currently displayed by the Button component. The panel located to the right of the design area is the Attributes panel. This panel displays the attributes assigned to the currently selected component in the layout. Within this panel, locate the *text* property in the Common Attributes section and change the current value from "Button" to "Convert" as shown in Figure 3-13:

Figure 3-13

The second text property with a wrench next to it allows a text property to be set which only appears within the Layout Editor tool but is not shown at runtime. This is useful for testing the way in which a visual component and the layout will behave with different settings without having to run the app repeatedly.

Just in case the Autoconnect system failed to set all of the layout connections, click on the Infer constraints button (Figure 3-14) to add any missing constraints to the layout:

Figure 3-14

At this point it is important to explain the warning button located in the top right-hand corner of the Layout Editor tool as indicated in Figure 3-15. Obviously, this is indicating potential problems with the layout. For details on any problems, click on the button:

Figure 3-15

When clicked, a panel (Figure 3-16) will appear describing the nature of the problems and offering some possible corrective measures:

Figure 3-16

Currently, the only warning listed reads as follows:

```
Hardcoded string "Convert", should use @string resource
```

This I18N message is informing us that a potential issue exists with regard to the future internationalization of the project ("I18N" comes from the fact that the word "internationalization" begins with an "I", ends with an "N" and has 18 letters in between). The warning is reminding us that when developing Android applications, attributes and values such as text strings should be stored in the form of *resources* wherever possible. Doing so enables changes to the appearance of the application to be made by modifying resource files instead of changing the application source code. This can be especially valuable when translating a user interface to a different

spoken language. If all of the text in a user interface is contained in a single resource file, for example, that file can be given to a translator who will then perform the translation work and return the translated file for inclusion in the application. This enables multiple languages to be targeted without the necessity for any source code changes to be made. In this instance, we are going to create a new resource named *convert\_string* and assign to it the string “Convert”.

Click on the *Fix* button in the Issue Explanation panel to display the *Extract Resource* panel (Figure 3-17). Within this panel, change the resource name field to *convert\_string* and leave the resource value set to *Convert* before clicking on the *OK* button.

Figure 3-17

It is also worth noting that the string could also have been assigned to a resource when it was entered into the Attributes panel. This involves clicking on the narrow button to the right of the property field in the Attributes panel and selecting the *Add new resource -> New String Value...* menu option from the resulting Resources dialog. In practice, however, it is often quicker to simply set values directly into the Attributes panel fields for any widgets in the layout, then work sequentially through the list in the warnings dialog to extract any necessary resources when the layout is complete.

The next widget to be added is an *EditText* widget into which the user will enter the dollar amount to be converted. From the widget palette, select the Text category and click and drag a Number (Decimal) component onto the layout so that it is centered horizontally and positioned above the existing *TextView* widget. With the widget selected, use the Attributes tools window to set the *hint* property to “dollars”. Click on the warning icon and extract the string to a resource named *dollars\_hint*.

Add any missing layout constraints by clicking on the *Infer constraints* button. At this point the layout should resemble that shown in Figure 3-18:

Figure 3-18

The code written later in this chapter will need to access the dollar value entered by the user into the EditText field. It will do this by referencing the id assigned to the widget in the user interface layout. The default id assigned to the widget by Android Studio can be viewed and changed from within the Attributes tool window when the widget is selected in the layout as shown in Figure 3-19:

Figure 3-19

Change the id to *dollarText* before proceeding.

### 3.6 Reviewing the Layout and Resource Files

Before moving on to the next step, we are going to look at some of the internal aspects of user interface design and resource handling. In the previous section, we made some changes to the user interface by modifying the *content\_main.xml* file using the Layout Editor tool. In fact, all that the Layout Editor was doing was providing a user-friendly way to edit the underlying XML content of the file. In practice, there is no reason why you cannot modify the XML directly in order to make user interface changes and, in some instances, this may actually be quicker than using the Layout Editor tool. At the bottom of the Layout Editor panel are two tabs labeled *Design*

and *Text* respectively. To switch to the XML view simply select the *Text* tab as shown in Figure 3-20:

Figure 3-20

As can be seen from the structure of the XML file, the user interface consists of the `ConstraintLayout` component, which in turn, is the parent of the `Button` object. We can also see that the `text` property of the `Button` is set to our `convert_string` resource. Although varying in complexity and content, all user interface layouts are structured in this hierarchical, XML based way.

One of the more powerful features of Android Studio can be found to the right-hand side of the XML editing panel. If the panel is not visible, display it by selecting the *Preview* button located along the right-hand edge of the Android Studio window. This is the Preview panel and shows the current visual state of the layout. As changes are made to the XML layout, these will be reflected in the preview panel. The layout may also be modified visually from within the Preview panel with the changes appearing in the XML listing. To see this in action, modify the XML layout to change the background color of the `ConstraintLayout` to a shade of red as follows:

```
<?xml version="1.0" encoding="utf-8"?>
<androidx.constraintlayout.widget.ConstraintLayout
    xmlns:android="http://schemas.android.com/apk/res/android"
    xmlns:app="http://schemas.android.com/apk/res-auto"
    xmlns:tools="http://schemas.android.com/tools"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    app:layout_behavior="@string/appbar_scrolling_view_behavior"
    tools:context=".MainActivity"
    tools:showIn="@layout/activity_main"
    android:background="#ff2438" >

    .
    .

</androidx.constraintlayout.widget.ConstraintLayout>
```

Note that the color of the preview changes in real-time to match the new setting in the XML file. Note also that

## Creating an Example Android App in Android Studio

a small red square appears in the left-hand margin (also referred to as the *gutter*) of the XML editor next to the line containing the color setting. This is a visual cue to the fact that the color red has been set on a property.

Before proceeding, delete the background property from the layout file so that the background returns to the default setting.

Finally, use the Project view to locate the *app -> res -> values -> strings.xml* file and double-click on it to load it into the editor. Currently the XML should read as follows:

```
<resources>
    <string name="app_name">AndroidSample</string>
    <string name="action_settings">Settings</string>
    <string name="convert_string">Convert</string>
    <string name="dollars_hint">dollars</string>
</resources>
```

As a demonstration of resources in action, change the string value currently assigned to the *convert\_string* resource to “Convert to Euros” and then return to the Layout Editor tool by selecting the tab for the layout file in the editor panel. Note that the layout has picked up the new resource value for the string.

There is also a quick way to access the value of a resource referenced in an XML file. With the Layout Editor tool in Text mode, click on the “@string/convert\_string” property setting so that it highlights and then press Ctrl-B on the keyboard (Cmd-B on macOS). Android Studio will subsequently open the *strings.xml* file and take you to the line in that file where this resource is declared. Use this opportunity to revert the string resource back to the original “Convert” text and to add the following additional entry for a string resource that will be referenced later in the app code:

```
<resources>
    <string name="app_name">AndroidSample</string>
    <string name="action_settings">Settings</string>
    <string name="convert_string">Convert</string>
    <string name="dollars_hint">dollars</string>
    <string name="no_value_string">No Value</string>
</resources>
```

Resource strings may also be edited using the Android Studio Translations Editor. To open this editor, right-click on the *app -> res -> values -> strings.xml* file and select the *Open editor* menu option. This will display the Translation Editor in the main panel of the Android Studio window:

Figure 3-21

This editor allows the strings assigned to resource keys to be edited and for translations for multiple languages to be managed.

### 3.7 Adding Interaction

The final step in this example project is to make the app interactive so that when the user enters a dollar value into the `EditText` field and clicks the convert button the converted euro value appears on the `TextView`. This involves the implementation of some event handling on the `Button` widget. Specifically, the `Button` needs to be configured so that a method in the app code is called when an `onClick` event is triggered. Event handling can be implemented in a number of different ways and is covered in detail in a later chapter entitled “*An Overview and Example of Android Event Handling*”. Return the layout editor to Design mode, select the `Button` widget in the layout editor, refer to the Attributes tool window and specify a method named `convertCurrency` as shown below:

Declared Attributes	
layout_width	wrap_content
layout_height	wrap_content
layout_constraintTop	@+id/textView
layout_constraintEnd	parent
layout_constraintStart	parent
layout_marginTop	87dp
id	button
onClick	convertCurrency
text	@string/convert

Figure 3-22

Note that the text field for the `onClick` property is now highlighted with a red border to warn us that the button has been configured to call a method which does not yet exist. To address this, double-click on the `MainActivity.kt` file to load it into the code editor and add the code for the `convertCurrency` method to the class file so that it reads as follows, noting that it is also necessary to import some additional Android packages:

```
package com.ebookfrenzy.androidsample

import android.os.Bundle
import com.google.android.material.snackbar.Snackbar
import androidx.appcompat.app.AppCompatActivity
import android.view.Menu
import android.view.MenuItem
import android.view.View

import kotlinx.android.synthetic.main.activity_main.*
import kotlinx.android.synthetic.main.content_main.*

class MainActivity : AppCompatActivity() {

    fun convertCurrency(view: View) {

        if (dollarText.text.isNotEmpty()) {

            val dollarValue = dollarText.text.toString().toFloat()
            ...
        }
    }
}
```

```
    val euroValue = dollarValue * 0.85f

    textView.text = euroValue.toString()
} else {
    textView.text = getString(R.string.no_value_string)
}
}

.
.
}
```

The method begins by checking the text property of the dollarText EditText view to make sure that it is not empty (in other words that the user has entered a dollar value). If a value has not been entered, a “No Value” string is displayed on the resultText view using the string resource declared earlier in the chapter. If, on the other hand, a dollar amount has been entered, it is converted into a floating point value and the equivalent euro value calculated. This floating point value is then converted into a string and displayed on the resultText view. If any of this is unclear, rest assured that these concepts will be covered in greater detail in later chapters.

The project is now complete and ready to run, a task that will be performed in the next chapter after an AVD emulator session as been created for testing purposes.

### 3.8 Summary

While not excessively complex, a number of steps are involved in setting up an Android development environment. Having performed those steps, it is worth working through a simple example to make sure the environment is correctly installed and configured. In this chapter, we have created a simple application and then used the Android Studio Layout Editor tool to modify the user interface layout. In doing so, we explored the importance of using resources wherever possible, particularly in the case of string values, and briefly touched on the topic of layouts. Next we looked at the underlying XML that is used to store the user interface designs of Android applications.

While it is useful to be able to preview a layout from within the Android Studio Layout Editor tool, there is no substitute for testing an application by compiling and running it.

Finally, an onClick event was added to a Button connected to a method that was implemented to extract the user input from the EditText component, convert from dollars to euros and then display the result on the TextView.

With the app ready for testing, the steps necessary to set up an emulator for testing purposes will be covered in detail in the next chapter.

## 4. Creating an Android Virtual Device (AVD) in Android Studio

In the course of developing Android apps in Android Studio it will be necessary to compile and run an application multiple times. An Android application may be tested by installing and running it either on a physical device or in an *Android Virtual Device (AVD)* emulator environment. Before an AVD can be used, it must first be created and configured to match the specifications of a particular device model. The goal of this chapter, therefore, is to work through the steps involved in creating such a virtual device using the Pixel 3 phone as a reference example.

### 4.1 About Android Virtual Devices

AVDs are essentially emulators that allow Android applications to be tested without the necessity to install the application on a physical Android based device. An AVD may be configured to emulate a variety of hardware features including options such as screen size, memory capacity and the presence or otherwise of features such as a camera, GPS navigation support or an accelerometer. As part of the standard Android Studio installation, a number of emulator templates are installed allowing AVDs to be configured for a range of different devices. Custom configurations may be created to match any physical Android device by specifying properties such as processor type, memory capacity and the size and pixel density of the screen.

When launched, an AVD will appear as a window containing an emulated Android device environment. Figure 4-1, for example, shows an AVD session configured to emulate the Google Pixel 3 model.

New AVDs are created and managed using the Android Virtual Device Manager, which may be used either in command-line mode or with a more user-friendly graphical user interface.

Figure 4-1

### 4.2 Creating a New AVD

In order to test the behavior of an application in the absence of a physical device, it will be necessary to create an AVD for a specific Android device configuration.

To create a new AVD, the first step is to launch the AVD Manager. This can be achieved from within the Android Studio environment by selecting the *Tools -> AVD Manager* menu option from within the main window.

Once launched, the tool will appear as outlined in Figure 4-2 if existing AVD instances have been created:

Figure 4-2

To add an additional AVD, begin by clicking on the *Create Virtual Device* button in order to invoke the *Virtual Device Configuration* dialog:

Figure 4-3

Within the dialog, perform the following steps to create a Nexus 5X compatible emulator:

1. From the *Category* panel, select the *Phone* option to display the list of available Android tablet AVD templates.

2. Select the *Pixel 3* device option and click *Next*.
3. On the System Image screen, select the latest version of Android for the *x86* ABI. Note that if the system image has not yet been installed a *Download* link will be provided next to the Release Name. Click this link to download and install the system image before selecting it. If the image you need is not listed, click on the *x86 images* and *Other images* tabs to view alternative lists.
4. Click *Next* to proceed and enter a descriptive name (for example *Pixel 3 API 29*) into the name field or simply accept the default name.
5. Click *Finish* to create the AVD.
6. With the AVD created, the AVD Manager may now be closed. If future modifications to the AVD are necessary, simply re-open the AVD Manager, select the AVD from the list and click on the pencil icon in the *Actions* column of the device row in the AVD Manager.

### 4.3 Starting the Emulator

To perform a test run of the newly created AVD emulator, simply select the emulator from the AVD Manager and click on the launch button (the green triangle in the Actions column). The emulator will appear in a new window and begin the startup process. The amount of time it takes for the emulator to start will depend on the configuration of both the AVD and the system on which it is running.

Although the emulator probably defaulted to appearing in portrait orientation, this and other default options can be changed. Within the AVD Manager, select the new Nexus 5X entry and click on the pencil icon in the *Actions* column of the device row. In the configuration screen locate the *Startup and orientation* section and change the orientation setting. Exit and restart the emulator session to see this change take effect. More details on the emulator are covered in the next chapter (“*Using and Configuring the Android Studio AVD Emulator*”).

To save time in the next section of this chapter, leave the emulator running before proceeding.

### 4.4 Running the Application in the AVD

With an AVD emulator configured, the example *AndroidSample* application created in the earlier chapter now can be compiled and run. With the *AndroidSample* project loaded into Android Studio, make sure that the newly created Pixel 3 AVD is displayed in the device menu (marked A in Figure 4-4 below), then either click on the run button represented by a green triangle (B), select the *Run -> Run 'app'* menu option or use the Ctrl-R keyboard shortcut:

Figure 4-4

The device menu (A) may be used to select a different AVD instance or physical device as the run target, and also to run the app on multiple devices. The menu also provides access to the AVD Manager and device connection trouble shooting options:

## Creating an Android Virtual Device (AVD) in Android Studio

Figure 4-5

Once the application is installed and running, the user interface for the MainActivity class will appear within the emulator:

Figure 4-6

In the event that the activity does not automatically launch, check to see if the launch icon has appeared among the apps on the emulator. If it has, simply click on it to launch the application. Once the run process begins, the Run tool window will become available. The Run tool window will display diagnostic information as the application package is installed and launched. Figure 4-7 shows the Run tool window output from a successful application launch:

Figure 4-7

If problems are encountered during the launch process, the Run tool window will provide information that will hopefully help to isolate the cause of the problem.

Assuming that the application loads into the emulator and runs as expected, we have safely verified that the Android development environment is correctly installed and configured.

## 4.5 Stopping a Running Application

To stop a running application, simply click on the stop button located in the main toolbar as shown in Figure 4-8:

Figure 4-8

An app may also be terminated using the Run tool window. Begin by displaying the *Run* tool window using the window bar button that becomes available when the app is running. Once the Run tool window appears, click the stop button highlighted in Figure 4-9 below:

Figure 4-9

## 4.6 Supporting Dark Theme

Android 10 introduced the much awaited dark theme, support for which is not enabled by default in Android Studio app projects. To test dark theme in the AVD emulator, open the Settings app, choose the *Display* category and enable the *Dark Theme* option as shown in Figure 4-10 so that the screen background turns black:

Figure 4-10

With dark theme enabled, run the *AndroidSample* app and note that it appears as before and does not conform to the dark theme.

In order for an app to adopt dark theme, it must be derived from the *Android DayNight* theme. By default, new projects use the *Light.DarkActionBar* theme. To change this setting, navigate to the *res -> values -> styles.xml* file in the Project window as shown in Figure 4-11 and double-click on it to load it into the editor:

## Creating an Android Virtual Device (AVD) in Android Studio

Figure 4-11

Once loaded, edit the AppTheme style entry so that it reads as follows:

```
<resources>

    <!-- Base application theme. -->
    <style name="AppTheme" parent="Theme.AppCompat.DayNight">
        <!-- Customize your theme here. -->
    .
    .

```

After making the change, re-run the app on the emulator and note that it now conforms to the dark theme as shown in Figure 4-12:

Figure 4-12

Open the Settings app, turn off dark theme and return to the AndroidSample app. The app should have

automatically switched back to light mode.

## 4.7 AVD Command-line Creation

As previously discussed, in addition to the graphical user interface it is also possible to create a new AVD directly from the command-line. This is achieved using the *avdmanager* tool in conjunction with some command-line options. Once initiated, the tool will prompt for additional information before creating the new AVD.

The *avdmanager* tool requires access to the Java Runtime Environment (JRE) in order to run. If, when attempting to run *avdmanager*, an error message appears indicating that the ‘*java*’ command cannot be found, the command prompt or terminal window within which you are running the command can be configured to use the OpenJDK environment bundled with Android Studio. Begin by identifying the location of the OpenJDK JRE as follows:

1. Launch Android Studio and open the *AndroidSample* project created earlier in the book.
2. Select the *File -> Project Structure...* menu option.
3. Copy the path contained within the *JDK location* field of the Project Structure dialog. This represents the location of the JRE bundled with Android Studio.

On Windows, execute the following command within the command prompt window from which *avdmanager* is to be run (where *<path to jre>* is replaced by the path copied from the Project Structure dialog above):

```
set JAVA_HOME=<path to jre>
```

On macOS or Linux, execute the following command:

```
export JAVA_HOME="<path to jre>"
```

If you expect to use the *avdmanager* tool frequently, follow the environment variable steps for your operating system outlined in the chapter entitled “*Setting up an Android Studio Development Environment*” to configure *JAVA\_HOME* on a system-wide basis.

Assuming that the system has been configured such that the Android SDK *tools* directory is included in the PATH environment variable, a list of available targets for the new AVD may be obtained by issuing the following command in a terminal or command window:

```
avdmanager list targets
```

The resulting output from the above command will contain a list of Android SDK versions that are available on the system. For example:

```
Available Android targets:
```

```
-----
```

```
id: 1 or "android-29"
```

```
    Name: Android API 29
    Type: Platform
    API level: 29
    Revision: 1
```

```
-----
```

```
id: 2 or "android-26"
```

```
    Name: Android API 26
    Type: Platform
    API level: 26
    Revision: 1
```

The *avdmanager* tool also allows new AVD instances to be created from the command line. For example, to

## Creating an Android Virtual Device (AVD) in Android Studio

create a new AVD named *myAVD* using the target ID for the Android API level 29 device using the x86 ABI, the following command may be used:

```
avdmanager create avd -n myAVD -k "system-images;android-29;google_apis_playstore;x86"
```

The android tool will create the new AVD to the specifications required for a basic Android 8 device, also providing the option to create a custom configuration to match the specification of a specific device if required. Once a new AVD has been created from the command line, it may not show up in the Android Device Manager tool until the *Refresh* button is clicked.

In addition to the creation of new AVDs, a number of other tasks may be performed from the command line. For example, a list of currently available AVDs may be obtained using the *list avd* command line arguments:

```
avdmanager list avd
```

Available Android Virtual Devices:

```
Name: Pixel_XL_API_28_No_Play
Device: pixel_xl (Google)
Path: /Users/neilsmyth/.android/avd/Pixel_XL_API_28_No_Play.avd
Target: Google APIs (Google Inc.)
Based on: Android API 28 Tag/ABI: google_apis/x86
Skin: pixel_xl_silver
Sdcard: 512M
```

Similarly, to delete an existing AVD, simply use the *delete* option as follows:

```
avdmanager delete avd -n <avd name>
```

## 4.8 Android Virtual Device Configuration Files

By default, the files associated with an AVD are stored in the *.android/avd* sub-directory of the user's home directory, the structure of which is as follows (where *<avd name>* is replaced by the name assigned to the AVD):

```
<avd name>.avd/config.ini
<avd name>.avd/userdata.img
<avd name>.ini
```

The *config.ini* file contains the device configuration settings such as display dimensions and memory specified during the AVD creation process. These settings may be changed directly within the configuration file and will be adopted by the AVD when it is next invoked.

The *<avd name>.ini* file contains a reference to the target Android SDK and the path to the AVD files. Note that a change to the *image.sysdir* value in the *config.ini* file will also need to be reflected in the *target* value of this file.

## 4.9 Moving and Renaming an Android Virtual Device

The current name or the location of the AVD files may be altered from the command line using the *avdmanager* tool's *move avd* argument. For example, to rename an AVD named Nexus9 to Nexus9B, the following command may be executed:

```
avdmanager move avd -n Nexus9 -r Nexus9B
```

To physically relocate the files associated with the AVD, the following command syntax should be used:

```
avdmanager move avd -n <avd name> -p <path to new location>
```

For example, to move an AVD from its current file system location to */tmp/Nexus9Test*:

```
avdmanager move avd -n Nexus9 -p /tmp/Nexus9Test
```

Note that the destination directory must not already exist prior to executing the command to move an AVD.

## 4.10 Summary

A typical application development process follows a cycle of coding, compiling and running in a test environment. Android applications may be tested on either a physical Android device or using an Android Virtual Device (AVD) emulator. AVDs are created and managed using the Android AVD Manager tool which may be used either as a command line tool or using a graphical user interface. When creating an AVD to simulate a specific Android device model it is important that the virtual device be configured with a hardware specification that matches that of the physical device.

# Chapter 5

## 5. Using and Configuring the Android Studio AVD Emulator

The Android Virtual Device (AVD) emulator environment bundled with Android Studio 1.x was an uncharacteristically weak point in an otherwise reputable application development environment. Regarded by many developers as slow, inflexible and unreliable, the emulator was long overdue for an overhaul. Fortunately, Android Studio 2 introduced an enhanced emulator environment providing significant improvements in terms of configuration flexibility and overall performance and further enhancements have been made in subsequent releases.

Before the next chapter explores testing on physical Android devices, this chapter will take some time to provide an overview of the Android Studio AVD emulator and highlight many of the configuration features that are available to customize the environment.

### 5.1 The Emulator Environment

When launched, the emulator displays an initial splash screen during the loading process. Once loaded, the main emulator window appears containing a representation of the chosen device type (in the case of Figure 5-1 this is a Nexus 5X device):

Figure 5-1

Positioned along the right-hand edge of the window is the toolbar providing quick access to the emulator controls and configuration options.

### 5.2 The Emulator Toolbar Options

The emulator toolbar (Figure 5-2) provides access to a range of options relating to the appearance and behavior of the emulator environment.

## Using and Configuring the Android Studio AVD Emulator

Figure 5-2

Each button in the toolbar has associated with it a keyboard accelerator which can be identified either by hovering the mouse pointer over the button and waiting for the tooltip to appear, or via the help option of the extended controls panel.

Though many of the options contained within the toolbar are self-explanatory, each option will be covered for the sake of completeness:

- **Exit / Minimize** – The uppermost ‘x’ button in the toolbar exits the emulator session when selected while the ‘-’ option minimizes the entire window.
- **Power** – The Power button simulates the hardware power button on a physical Android device. Clicking and releasing this button will lock the device and turn off the screen. Clicking and holding this button will initiate the device “Power off” request sequence.
- **Volume Up / Down** – Two buttons that control the audio volume of playback within the simulator environment.
- **Rotate Left/Right** – Rotates the emulated device between portrait and landscape orientations.
- **Take Screenshot** – Takes a screenshot of the content currently displayed on the device screen. The captured image is stored at the location specified in the Settings screen of the extended controls panel as outlined later in this chapter.
- **Zoom Mode** – This button toggles in and out of zoom mode, details of which will be covered later in this chapter.
- **Back** – Simulates selection of the standard Android “Back” button. As with the Home and Overview buttons outlined below, the same results can be achieved by selecting the actual buttons on the emulator screen.
- **Home** – Simulates selection of the standard Android “Home” button.
- **Overview** – Simulates selection of the standard Android “Overview” button which displays the currently running apps on the device.
- **Fold Device** – Simulates the folding and unfolding of a foldable device. This option is only available if the

emulator is running a foldable device system image.

- **Extended Controls** – Displays the extended controls panel, allowing for the configuration of options such as simulated location and telephony activity, battery strength, cellular network type and fingerprint identification.

## 5.3 Working in Zoom Mode

The zoom button located in the emulator toolbar switches in and out of zoom mode. When zoom mode is active the toolbar button is depressed and the mouse pointer appears as a magnifying glass when hovering over the device screen. Clicking the left mouse button will cause the display to zoom in relative to the selected point on the screen, with repeated clicking increasing the zoom level. Conversely, clicking the right mouse button decreases the zoom level. Toggling the zoom button off reverts the display to the default size.

Clicking and dragging while in zoom mode will define a rectangular area into which the view will zoom when the mouse button is released.

While in zoom mode the visible area of the screen may be panned using the horizontal and vertical scrollbars located within the emulator window.

## 5.4 Resizing the Emulator Window

The size of the emulator window (and the corresponding representation of the device) can be changed at any time by clicking and dragging on any of the corners or sides of the window.

## 5.5 Extended Control Options

The extended controls toolbar button displays the panel illustrated in Figure 5-3. By default, the location settings will be displayed. Selecting a different category from the left-hand panel will display the corresponding group of controls:

Figure 5-3

### 5.5.1 Location

The location controls allow simulated location information to be sent to the emulator in the form of decimal or sexagesimal coordinates. Location information can take the form of a single location, or a sequence of points representing movement of the device, the latter being provided via a file in either GPS Exchange (GPX) or Keyhole Markup Language (KML) format.

A single location is transmitted to the emulator when the *Send* button is clicked. The transmission of GPS data

## Using and Configuring the Android Studio AVD Emulator

points begins once the “play” button located beneath the data table is selected. The speed at which the GPS data points are fed to the emulator can be controlled using the speed menu adjacent to the play button.

### 5.5.2 Cellular

The type of cellular connection being simulated can be changed within the cellular settings screen. Options are available to simulate different network types (CSM, EDGE, HSDPA etc) in addition to a range of voice and data scenarios such as roaming and denied access.

### 5.5.3 Camera

The emulator simulates a 3D scene when the camera is active. This takes the form of the interior of a virtual building through which you can navigate by holding down the Option key (Alt on Windows) while using the mouse pointer and keyboard keys when recording video or before taking a photo within the emulator. This extended configuration option allows different images to be uploaded for display within the virtual environment.

### 5.5.4 Battery

A variety of battery state and charging conditions can be simulated on this panel of the extended controls screen, including battery charge level, battery health and whether the AC charger is currently connected.

### 5.5.5 Phone

The phone extended controls provide two very simple but useful simulations within the emulator. The first option allows for the simulation of an incoming call from a designated phone number. This can be of particular use when testing the way in which an app handles high level interrupts of this nature.

The second option allows the receipt of text messages to be simulated within the emulator session. As in the real world, these messages appear within the Message app and trigger the standard notifications within the emulator.

### 5.5.6 Directional Pad

A directional pad (D-Pad) is an additional set of controls either built into an Android device or connected externally (such as a game controller) that provides directional controls (left, right, up, down). The directional pad settings allow D-Pad interaction to be simulated within the emulator.

### 5.5.7 Microphone

The microphone settings allow the microphone to be enabled and virtual headset and microphone connections to be simulated. A button is also provided to launch the Voice Assistant on the emulator.

### 5.5.8 Fingerprint

Many Android devices are now supplied with built-in fingerprint detection hardware. The AVD emulator makes it possible to test fingerprint authentication without the need to test apps on a physical device containing a fingerprint sensor. Details on how to configure fingerprint testing within the emulator will be covered in detail later in this chapter.

### 5.5.9 Virtual Sensors

The virtual sensors option allows the accelerometer and magnetometer to be simulated to emulate the effects of the physical motion of a device such as rotation, movement and tilting through yaw, pitch and roll settings.

### 5.5.10 Snapshots

Snapshots contain the state of the currently running AVD session to be saved and rapidly restored making it easy to return the emulator to an exact state. Snapshots are covered in detail later in this chapter.

### 5.5.11 Record and Playback

Allows the emulator screen and audio to be recorded and saved in either WebM or animated GIF format.

### 5.5.12 Google Play

If the emulator is running a version of Android with Google Play Services installed, this option displays the current Google Play version and provides the option to update the emulator to the latest version.

### 5.5.13 Settings

The settings panel provides a small group of configuration options. Use this panel to choose a darker theme for the toolbar and extended controls panel, specify a file system location into which screenshots are to be saved, configure OpenGL support levels, and to configure the emulator window to appear on top of other windows on the desktop.

### 5.5.14 Help

The Help screen contains three sub-panels containing a list of keyboard shortcuts, links to access the emulator online documentation, file bugs and send feedback, and emulator version information.

## 5.6 Working with Snapshots

When an emulator starts for the very first time it performs a *cold boot* much like a physical Android device when it is powered on. This cold boot process can take some time to complete as the operating system loads and all the background processes are started. To avoid the necessity of going through this process every time the emulator is started, the system is configured to automatically save a snapshot (referred to as a *quick-boot snapshot*) of the emulator's current state each time it exits. The next time the emulator is launched, the quick-boot snapshot is loaded into memory and execution resumes from where it left off previously, allowing the emulator to restart in a fraction of the time needed for a cold boot to complete.

The Snapshots screen of the extended controls panel can be used to store additional snapshots at any point during the execution of the emulator. This saves the exact state of the entire emulator allowing the emulator to be restored to the exact point in time that the snapshot was taken. From within the screen, snapshots can be taken using the *Take Snapshot* button (marked A in Figure 5-4). To restore an existing snapshot, select it from the list (B) and click the run button (C) located at the bottom of the screen. Options are also provided to edit (D) the snapshot name and description and to delete (E) the currently selected snapshot:

Figure 5-4

The Settings option (F) provides the option to configure the automatic saving of quick-boot snapshots (by default the emulator will ask whether to save the quick boot snapshot each time the emulator exits) and to reload the most recent snapshot. To force an emulator session to perform a cold boot instead of using a previous

## Using and Configuring the Android Studio AVD Emulator

quick-boot snapshot, open the AVD Manager (*Tools -> AVD Manager*), click on the down arrow in the actions column for the emulator and select the Cold Boot Now menu option.

Figure 5-5

## 5.7 Configuring Fingerprint Emulation

The emulator allows up to 10 simulated fingerprints to be configured and used to test fingerprint authentication within Android apps. To configure simulated fingerprints begin by launching the emulator, opening the Settings app and selecting the *Security & Location* option.

Within the Security settings screen, select the *Use fingerprint* option. On the resulting information screen click on the *Next* button to proceed to the Fingerprint setup screen. Before fingerprint security can be enabled a backup screen unlocking method (such as a PIN number) must be configured. Click on the *Fingerprint + PIN* button and, when prompted, choose not to require the PIN on device startup. Enter and confirm a suitable PIN number and complete the PIN entry process by accepting the default notifications option.

Proceed through the remaining screens until the Settings app requests a fingerprint on the sensor. At this point display the extended controls dialog, select the *Fingerprint* category in the left-hand panel and make sure that *Finger 1* is selected in the main settings panel:

Figure 5-6

Click on the *Touch the Sensor* button to simulate Finger 1 touching the fingerprint sensor. The emulator will report the successful addition of the fingerprint:

Figure 5-7

To add additional fingerprints click on the *Add Another* button and select another finger from the extended controls panel menu before clicking on the *Touch the Sensor* button once again. The topic of building fingerprint authentication into an Android app is covered in detail in the chapter entitled “*An Android Biometric Authentication Tutorial*”.

## 5.8 Summary

Android Studio 3.5 contains a new and improved Android Virtual Device emulator environment designed to make it easier to test applications without the need to run on a physical Android device. This chapter has provided a brief tour of the emulator and highlighted key features that are available to configure and customize the environment to simulate different testing conditions

## 6. A Tour of the Android Studio User Interface

While it is tempting to plunge into running the example application created in the previous chapter, doing so involves using aspects of the Android Studio user interface which are best described in advance.

Android Studio is a powerful and feature rich development environment that is, to a large extent, intuitive to use. That being said, taking the time now to gain familiarity with the layout and organization of the Android Studio user interface will considerably shorten the learning curve in later chapters of the book. With this in mind, this chapter will provide an initial overview of the various areas and components that make up the Android Studio environment.

### 6.1 The Welcome Screen

The welcome screen (Figure 6-1) is displayed any time that Android Studio is running with no projects currently open (open projects can be closed at any time by selecting the *File -> Close Project* menu option). If Android Studio was previously exited while a project was still open, the tool will by-pass the welcome screen next time it is launched, automatically opening the previously active project.

Figure 6-1

In addition to a list of recent projects, the Quick Start menu provides a range of options for performing tasks such as opening, creating and importing projects along with access to projects currently under version control. In addition, the *Configure* menu at the bottom of the window provides access to the SDK Manager along with a vast array of settings and configuration options. A review of these options will quickly reveal that there is almost no aspect of Android Studio that cannot be configured and tailored to your specific needs.

The *Configure* menu also includes an option to check if updates to Android Studio are available for download.

## 6.2 The Main Window

When a new project is created, or an existing one opened, the Android Studio *main window* will appear. When multiple projects are open simultaneously, each will be assigned its own main window. The precise configuration of the window will vary depending on which tools and panels were displayed the last time the project was open, but will typically resemble that of Figure 6-2.

Figure 6-2

The various elements of the main window can be summarized as follows:

**A – Menu Bar** – Contains a range of menus for performing tasks within the Android Studio environment.

**B – Toolbar** – A selection of shortcuts to frequently performed actions. The toolbar buttons provide quicker access to a select group of menu bar actions. The toolbar can be customized by right-clicking on the bar and selecting the *Customize Menus and Toolbars...* menu option.

**C – Navigation Bar** – The navigation bar provides a convenient way to move around the files and folders that make up the project. Clicking on an element in the navigation bar will drop down a menu listing the subfolders and files at that location ready for selection. This provides an alternative to the Project tool window.

**D – Editor Window** – The editor window displays the content of the file on which the developer is currently working. What gets displayed in this location, however, is subject to context. When editing code, for example, the code editor will appear. When working on a user interface layout file, on the other hand, the user interface Layout Editor tool will appear. When multiple files are open, each file is represented by a tab located along the top edge of the editor as shown in Figure 6-3.

The screenshot shows the Android Studio interface with two tabs open: 'AndroidSampleActivity.kt' and 'content\_android\_sample.xml'. The Java code in 'AndroidSampleActivity.kt' is displayed, starting with 'package com.ebookfrenzy.androidsample' and defining a class 'AndroidSampleActivity' extending 'AppCompatActivity'. The XML code in 'content\_android\_sample.xml' is partially visible at the top of the second tab.

```

1 package com.ebookfrenzy.androidsample
2
3 import ...
10
11 class AndroidSampleActivity : AppCompatActivity() {
12

```

Figure 6-3

**E – Status Bar** – The status bar displays informational messages about the project and the activities of Android Studio together with the tools menu button located in the far left corner. Hovering over items in the status bar will provide a description of that field. Many fields are interactive, allowing the user to click to perform tasks or obtain more detailed status information.

**F – Project Tool Window** – The project tool window provides a hierarchical overview of the project file structure allowing navigation to specific files and folders to be performed. The toolbar can be used to display the project in a number of different ways. The default setting is the *Android* view which is the mode primarily used in the remainder of this book.

The project tool window is just one of a number of tool windows available within the Android Studio environment.

### 6.3 The Tool Windows

In addition to the project view tool window, Android Studio also includes a number of other windows which, when enabled, are displayed along the bottom and sides of the main window. The tool window quick access menu can be accessed by hovering the mouse pointer over the button located in the far left-hand corner of the status bar (Figure 6-4) without clicking the mouse button.

Figure 6-4

Selecting an item from the quick access menu will cause the corresponding tool window to appear within the main window.

Alternatively, a set of *tool window bars* can be displayed by clicking on the quick access menu icon in the status bar. These bars appear along the left, right and bottom edges of the main window (as indicated by the arrows in

## A Tour of the Android Studio User Interface

Figure 6-5) and contain buttons for showing and hiding each of the tool windows. When the tool window bars are displayed, a second click on the button in the status bar will hide them.

Figure 6-5

Clicking on a button will display the corresponding tool window while a second click will hide the window. Buttons prefixed with a number (for example 1: Project) indicate that the tool window may also be displayed by pressing the Alt key on the keyboard (or the Command key for macOS) together with the corresponding number.

The location of a button in a tool window bar indicates the side of the window against which the window will appear when displayed. These positions can be changed by clicking and dragging the buttons to different locations in other window tool bars.

Each tool window has its own toolbar along the top edge. The buttons within these toolbars vary from one tool to the next, though all tool windows contain a settings option, represented by the cog icon, which allows various aspects of the window to be changed. Figure 6-6 shows the settings menu for the project view tool window. Options are available, for example, to undock a window and to allow it to float outside of the boundaries of the Android Studio main window and to move and resize the tool panel.

Figure 6-6

All of the windows also include a far right button on the toolbar providing an additional way to hide the tool window from view. A search of the items within a tool window can be performed simply by giving that window focus by clicking in it and then typing the search term (for example the name of a file in the Project tool window). A search box will appear in the window's tool bar and items matching the search highlighted.

Android Studio offers a wide range of tool windows, the most commonly used of which are as follows:

**Project** – The project view provides an overview of the file structure that makes up the project allowing for quick navigation between files. Generally, double-clicking on a file in the project view will cause that file to be loaded into the appropriate editing tool.

**Structure** – The structure tool provides a high level view of the structure of the source file currently displayed in the editor. This information includes a list of items such as classes, methods and variables in the file. Selecting an item from the structure list will take you to that location in the source file in the editor window.

**Layout Captures** – Provides access to all of the layout hierarchy snapshots previously captured using the Layout Inspector tool (*Tools -> Layout Inspector*).

**Favorites** – A variety of project items can be added to the favorites list. Right-clicking on a file in the project view, for example, provides access to an *Add to Favorites* menu option. Similarly, a method in a source file can be added as a favorite by right-clicking on it in the Structure tool window. Anything added to a Favorites list can be accessed through this Favorites tool window.

**Build Variants** – The build variants tool window provides a quick way to configure different build targets for the current application project (for example different builds for debugging and release versions of the application, or multiple builds to target different device categories).

**TODO** – As the name suggests, this tool provides a place to review items that have yet to be completed on the project. Android Studio compiles this list by scanning the source files that make up the project to look for comments that match specified TODO patterns. These patterns can be reviewed and changed by selecting the *File -> Settings... menu option (Android Studio -> Preferences... on macOS)* and navigating to the *TODO* page listed under *Editor*.

**Logcat** – The Logcat tool window provides access to the monitoring log output from a running application in addition to options for taking screenshots and videos of the application and stopping and restarting a process.

**Terminal** – Provides access to a terminal window on the system on which Android Studio is running. On Windows systems this is the Command Prompt interface, while on Linux and macOS systems this takes the form of a Terminal prompt.

**Build** - The build tool windows displays information about the build process while a project is being compiled and packaged and displays details of any errors encountered.

**Run** – The run tool window becomes available when an application is currently running and provides a view of the results of the run together with options to stop or restart a running process. If an application is failing to install and run on a device or emulator, this window will typically provide diagnostic information relating to the problem.

**Event Log** – The event log window displays messages relating to events and activities performed within Android Studio. The successful build of a project, for example, or the fact that an application is now running will be reported within this tool window.

**Gradle** – The Gradle tool window provides a view onto the Gradle tasks that make up the project build configuration. The window lists the tasks that are involved in compiling the various elements of the project into

## A Tour of the Android Studio User Interface

an executable application. Right-click on a top level Gradle task and select the *Open Gradle Config* menu option to load the Gradle build file for the current project into the editor. Gradle will be covered in greater detail later in this book.

**Profiler** – The Android Profiler tool window provides realtime monitoring and analysis tools for identifying performance issues within running apps, including CPU, memory and network usage. This option becomes available when an app is currently running.

**Device File Explorer** – The Device File Explorer tool window provides direct access to the filesystem of the currently connected Android device or emulator allowing the filesystem to be browsed and files copied to the local filesystem.

**Resource Manager** - A tool for adding and managing resources and assets such as images, colors and layout files contained with the project.

## 6.4 Android Studio Keyboard Shortcuts

Android Studio includes an abundance of keyboard shortcuts designed to save time when performing common tasks. A full keyboard shortcut keymap listing can be viewed and printed from within the Android Studio project window by selecting the *Help -> Keymap Reference* menu option.

## 6.5 Switcher and Recent Files Navigation

Another useful mechanism for navigating within the Android Studio main window involves the use of the *Switcher*. Accessed via the *Ctrl-Tab* keyboard shortcut, the switcher appears as a panel listing both the tool windows and currently open files (Figure 6-7).

Figure 6-7

Once displayed, the switcher will remain visible for as long as the Ctrl key remains depressed. Repeatedly tapping the Tab key while holding down the Ctrl key will cycle through the various selection options, while releasing the Ctrl key causes the currently highlighted item to be selected and displayed within the main window.

In addition to the switcher, navigation to recently opened files is provided by the Recent Files panel (Figure 6-8). This can be accessed using the Ctrl-E keyboard shortcut (Cmd-E on macOS). Once displayed, either the mouse pointer can be used to select an option or, alternatively, the keyboard arrow keys used to scroll through the file name and tool window options. Pressing the Enter key will select the currently highlighted item.

Figure 6-8

## 6.6 Changing the Android Studio Theme

The overall theme of the Android Studio environment may be changed either from the welcome screen using the *Configure -> Settings* option, or via the *File -> Settings...* menu option (*Android Studio -> Preferences...* on macOS) of the main window.

Once the settings dialog is displayed, select the *Appearance* option in the left-hand panel and then change the setting of the *Theme* menu before clicking on the *Apply* button. The themes available will depend on the platform but usually include options such as Light, IntelliJ, Windows, High Contrast and Darcula. Figure 6-9 shows an example of the main window with the Darcula theme selected:

Figure 6-9

## 6.7 Summary

The primary elements of the Android Studio environment consist of the welcome screen and main window. Each open project is assigned its own main window which, in turn, consists of a menu bar, toolbar, editing and design area, status bar and a collection of tool windows. Tool windows appear on the sides and bottom edges of the main window and can be accessed either using the quick access menu located in the status bar, or via the optional tool window bars.

There are very few actions within Android Studio which cannot be triggered via a keyboard shortcut. A keymap of default keyboard shortcuts can be accessed at any time from within the Android Studio main window.

## 7. Testing Android Studio Apps on a Physical Android Device

While much can be achieved by testing applications using an Android Virtual Device (AVD), there is no substitute for performing real world application testing on a physical Android device and there are a number of Android features that are only available on physical Android devices.

Communication with both AVD instances and connected Android devices is handled by the *Android Debug Bridge (ADB)*. In this chapter we will work through the steps to configure the adb environment to enable application testing on a physical Android device with macOS, Windows and Linux based systems.

### 7.1 An Overview of the Android Debug Bridge (ADB)

The primary purpose of the ADB is to facilitate interaction between a development system, in this case Android Studio, and both AVD emulators and physical Android devices for the purposes of running and debugging applications.

The ADB consists of a client, a server process running in the background on the development system and a daemon background process running in either AVDs or real Android devices such as phones and tablets.

The ADB client can take a variety of forms. For example, a client is provided in the form of a command-line tool named *adb* located in the Android SDK *platform-tools* sub-directory. Similarly, Android Studio also has a built-in client.

A variety of tasks may be performed using the *adb* command-line tool. For example, a listing of currently active virtual or physical devices may be obtained using the *devices* command-line argument. The following command output indicates the presence of an AVD on the system but no physical devices:

```
$ adb devices
List of devices attached
emulator-5554    device
```

### 7.2 Enabling ADB on Android based Devices

Before ADB can connect to an Android device, that device must first be configured to allow the connection. On phone and tablet devices running Android 6.0 or later, the steps to achieve this are as follows:

1. Open the Settings app on the device and select the *About tablet* or *About phone* option (on newer versions of Android this can be found on the *System* page of the Settings app).
2. On the *About* screen, scroll down to the *Build number* field (Figure 7-1) and tap on it seven times until a message appears indicating that developer mode has been enabled. If the build number is not displayed, unfold the Advanced section of the list.

## Testing Android Studio Apps on a Physical Android Device

Figure 7-1

- Return to the main Settings screen and note the appearance of a new option titled Developer options. Select this option and locate the setting on the developer screen entitled USB debugging. Enable the switch next to this item as illustrated in Figure 7-2:

Figure 7-2

- Swipe downward from the top of the screen to display the notifications panel (Figure 7-3) and note that the device is currently connected for debugging.

Figure 7-3

At this point, the device is now configured to accept debugging connections from adb on the development system. All that remains is to configure the development system to detect the device when it is attached. While this is a relatively straightforward process, the steps involved differ depending on whether the development system is running Windows, macOS or Linux. Note that the following steps assume that the Android SDK *platform-tools* directory is included in the operating system PATH environment variable as described in the chapter entitled “*Setting up an Android Studio Development Environment*”.

### 7.2.1 macOS ADB Configuration

In order to configure the ADB environment on a macOS system, connect the device to the computer system using a USB cable, open a terminal window and execute the following command to restart the adb server:

```
$ adb kill-server  
$ adb start-server  
* daemon not running. starting it now on port 5037 *  
* daemon started successfully *
```

Once the server is successfully running, execute the following command to verify that the device has been detected:

```
$ adb devices  
List of devices attached  
74CE000600000001      offline
```

If the device is listed as *offline*, go to the Android device and check for the presence of the dialog shown in Figure

7-4 seeking permission to *Allow USB debugging*. Enable the checkbox next to the option that reads *Always allow from this computer*, before clicking on *OK*. Repeating the *adb devices* command should now list the device as being available:

```
List of devices attached
015d41d4454bf80c      device
```

In the event that the device is not listed, try logging out and then back in to the macOS desktop and, if the problem persists, rebooting the system.

### 7.2.2 Windows ADB Configuration

The first step in configuring a Windows based development system to connect to an Android device using ADB is to install the appropriate USB drivers on the system. The USB drivers to install will depend on the model of Android Device. If you have a Google Nexus device, then it will be necessary to install and configure the Google USB Driver package on your Windows system. Detailed steps to achieve this are outlined on the following web page:

<https://developer.android.com/sdk/win-usb.html>

For Android devices not supported by the Google USB driver, it will be necessary to download the drivers provided by the device manufacturer. A listing of drivers together with download and installation information can be obtained online at:

<https://developer.android.com/tools/extras/oem-usb.html>

With the drivers installed and the device now being recognized as the correct device type, open a Command Prompt window and execute the following command:

```
adb devices
```

This command should output information about the connected device similar to the following:

```
List of devices attached
HT4CTJT01906      offline
```

If the device is listed as *offline* or *unauthorized*, go to the device display and check for the dialog shown in Figure 7-4 seeking permission to *Allow USB debugging*.

Figure 7-4

Enable the checkbox next to the option that reads *Always allow from this computer*, before clicking on *OK*. Repeating the *adb devices* command should now list the device as being ready:

```
List of devices attached
HT4CTJT01906      device
```

In the event that the device is not listed, execute the following commands to restart the ADB server:

## Testing Android Studio Apps on a Physical Android Device

```
adb kill-server  
adb start-server
```

If the device is still not listed, try executing the following command:

```
android update adb
```

Note that it may also be necessary to reboot the system.

### 7.2.3 Linux adb Configuration

For the purposes of this chapter, we will once again use Ubuntu Linux as a reference example in terms of configuring adb on Linux to connect to a physical Android device for application testing.

Physical device testing on Ubuntu Linux requires the installation of a package named *android-tools-adb* which, in turn, requires that the Android Studio user be a member of the *plugdev* group. This is the default for user accounts on most Ubuntu versions and can be verified by running the *id* command. If the *plugdev* group is not listed, run the following command to add your account to the group:

```
sudo usermod -aG plugdev $LOGNAME
```

After the group membership requirement has been met, the *android-tools-adb* package can be installed by executing the following command:

```
sudo apt-get install android-tools-adb
```

Once the above changes have been made, reboot the Ubuntu system. Once the system has restarted, open a Terminal window, start the adb server and check the list of attached devices:

```
$ adb start-server  
* daemon not running. starting it now on port 5037 *  
* daemon started successfully *  
$ adb devices  
List of devices attached  
015d41d4454bf80c      offline
```

If the device is listed as *offline* or *unauthorized*, go to the Android device and check for the dialog shown in Figure 7-4 seeking permission to *Allow USB debugging*.

### 7.3 Testing the adb Connection

Assuming that the adb configuration has been successful on your chosen development platform, the next step is to try running the test application created in the chapter entitled “*Creating an Example Android App in Android Studio*” on the device. Launch Android Studio, open the *AndroidSample* project and verify that the device appears in the device selection menu as highlighted in Figure 7-5:

Figure 7-5

Note that this menu also includes the option to test the app on multiple devices and emulators simultaneously.

When selected, this option displays the dialog shown in Figure 7-6 where multiple deployment targets may be selected.

Figure 7-6

## 7.4 Summary

While the Android Virtual Device emulator provides an excellent testing environment, it is important to keep in mind that there is no real substitute for making sure an application functions correctly on a physical Android device. This, after all, is where the application will be used in the real world.

By default, however, the Android Studio environment is not configured to detect Android devices as a target testing device. It is necessary, therefore, to perform some steps in order to be able to load applications directly onto an Android device from within the Android Studio development environment. The exact steps to achieve this goal differ depending on the development platform being used. In this chapter, we have covered those steps for Linux, macOS and Windows based platforms.

## 8. The Basics of the Android Studio Code Editor

Developing applications for Android involves a considerable amount of programming work which, by definition, involves typing, reviewing and modifying lines of code. It should come as no surprise that the majority of a developer's time spent using Android Studio will typically involve editing code within the editor window.

The modern code editor needs to go far beyond the original basics of typing, deleting, cutting and pasting. Today the usefulness of a code editor is generally gauged by factors such as the amount by which it reduces the typing required by the programmer, ease of navigation through large source code files and the editor's ability to detect and highlight programming errors in real-time as the code is being written. As will become evident in this chapter, these are just a few of the areas in which the Android Studio editor excels.

While not an exhaustive overview of the features of the Android Studio editor, this chapter aims to provide a guide to the key features of the tool. Experienced programmers will find that some of these features are common to most code editors available today, while a number are unique to this particular editing environment.

### 8.1 The Android Studio Editor

The Android Studio editor appears in the center of the main window when a Java, Kotlin, XML or other text based file is selected for editing. Figure 8-1, for example, shows a typical editor session with a Kotlin source code file loaded:

A screenshot of the Android Studio code editor showing a Kotlin file named `MainActivity.kt`. The code defines a `MainActivity` class that extends `AppCompatActivity`. It overrides the `onCreate` and `onCreateOptionsMenu` methods. The `onCreate` method sets the content view and adds a click listener to a fab button. The `onCreateOptionsMenu` method inflates a menu. The `onOptionsItemSelected` method handles action bar item clicks. The code editor has several UI elements highlighted with red circles:

- A:** A tab for the `MainActivity.kt` file.
- B:** A circular icon indicating a warning or error on line 15.
- C:** A circular icon indicating a warning or error on line 51.
- D:** A circular icon indicating a warning or error on line 21.
- E:** A circular icon indicating a warning or error on line 41.
- F:** A circular icon indicating a warning or error on line 52.

```
1 package com.example.androidsample
2
3 import android.os.Bundle
4 import com.google.android.material.snackbar.Snackbar
5 import android.appcompat.app.AppCompatActivity
6 import android.view.Menu
7 import android.view.MenuItem
8 import android.view.View
9
10 import kotlinx.android.synthetic.main.activity_main.*
11 import kotlinx.android.synthetic.main.content_main.*
12
13 class MainActivity : AppCompatActivity() {
14
15     override fun onCreate(savedInstanceState: Bundle?) {
16         super.onCreate(savedInstanceState)
17         setContentView(R.layout.activity_main)
18         setSupportActionBar(toolbar)
19
20         fab.setOnClickListener { view ->
21             Snackbar.make(view, text = "Replace with your own action", Snackbar.LENGTH_LONG)
22                 .setAction( text = "Action", listener = null).show()
23     }
24
25     fun convertCurrency(view: View) {...}
26
27     override fun onCreateOptionsMenu(menu: Menu): Boolean {
28         // Inflate the menu; this adds items to the action bar if it is present.
29         menuInflater.inflate(R.menu.menu_main, menu)
30         return true
31     }
32
33     override fun onOptionsItemSelected(item: MenuItem): Boolean {
34         // Handle action bar item clicks here. The action bar will
35         // automatically handle clicks on the Home/Up button, so long
36         // as you specify a parent activity in AndroidManifest.xml.
37         return when (item.itemId) {
38             R.id.action_settings -> true
39             else -> super.onOptionsItemSelected(item)
40         }
41     }

Figure 8-1

## The Basics of the Android Studio Code Editor

The elements that comprise the editor window can be summarized as follows:

**A – Document Tabs** – Android Studio is capable of holding multiple files open for editing at any one time. As each file is opened, it is assigned a document tab displaying the file name in the tab bar located along the top edge of the editor window. A small dropdown menu will appear in the far right-hand corner of the tab bar when there is insufficient room to display all of the tabs. Clicking on this menu will drop down a list of additional open files. A wavy red line underneath a file name in a tab indicates that the code in the file contains one or more errors that need to be addressed before the project can be compiled and run.

Switching between files is simply a matter of clicking on the corresponding tab or using the *Alt-Left* and *Alt-Right* keyboard shortcuts. Navigation between files may also be performed using the Switcher mechanism (accessible via the *Ctrl-Tab* keyboard shortcut).

To detach an editor panel from the Android Studio main window so that it appears in a separate window, click on the tab and drag it to an area on the desktop outside of the main window. To return the editor to the main window, click on the file tab in the separated editor window and drag and drop it onto the original editor tab bar in the main window.

**B – The Editor Gutter Area** - The gutter area is used by the editor to display informational icons and controls. Some typical items, among others, which appear in this gutter area are debugging breakpoint markers, controls to fold and unfold blocks of code, bookmarks, change markers and line numbers. Line numbers are switched on by default but may be disabled by right-clicking in the gutter and selecting the *Show Line Numbers* menu option.

**C – Code Structure Location** - This bar at the bottom of the editor displays the current position of the cursor as it relates to the overall structure of the code. In the following figure, for example, the bar indicates that a `setOnItemClickListener` method call is currently being edited, and that this line of code is contained within the `onCreate` method of the `MainActivity` class.

Figure 8-2

Selecting an element within the bar will move the cursor to the corresponding location within the code file. For example, selecting the `onCreate()` entry will move the cursor to the top of the `onCreate` method within the source code.

**D – The Editor Area** – This is the main area where the code is displayed, entered and edited by the user. Later sections of this chapter will cover the key features of the editing area in detail.

**E – The Validation and Marker Sidebar** – Android Studio incorporates a feature referred to as “on-the-fly code analysis”. What this essentially means is that as you are typing code, the editor is analyzing the code to check for warnings and syntax errors. The indicator at the top of the validation sidebar will change from a green check mark (no warnings or errors detected) to a yellow square (warnings detected) or red alert icon (errors have been detected). Clicking on this indicator will display a popup containing a summary of the issues found with the code in the editor as illustrated in Figure 8-3:

Figure 8-3

The sidebar also displays markers at the locations where issues have been detected using the same color coding. Hovering the mouse pointer over a marker when the line of code is visible in the editor area will display a popup containing a description of the issue (Figure 8-4):

Figure 8-4

Hovering the mouse pointer over a marker for a line of code which is currently scrolled out of the viewing area of the editor will display a “lens” overlay containing the block of code where the problem is located (Figure 8-5) allowing it to be viewed without the necessity to scroll to that location in the editor:

Figure 8-5

It is also worth noting that the lens overlay is not limited to warnings and errors in the sidebar. Hovering over any part of the sidebar will result in a lens appearing containing the code present at that location within the source file.

**F – The Status Bar** – Though the status bar is actually part of the main window, as opposed to the editor, it does contain some information about the currently active editing session. This information includes the current position of the cursor in terms of lines and characters and the encoding format of the file (UTF-8, ASCII etc.). Clicking on these values in the status bar allows the corresponding setting to be changed. Clicking on the line number, for example, displays the *Go to Line* dialog.

Having provided an overview of the elements that comprise the Android Studio editor, the remainder of this chapter will explore the key features of the editing environment in more detail.

## 8.2 Splitting the Editor Window

By default, the editor will display a single panel showing the content of the currently selected file. A particularly useful feature when working simultaneously with multiple source code files is the ability to split the editor into

## The Basics of the Android Studio Code Editor

multiple panes. To split the editor, right-click on a file tab within the editor window and select either the *Split Vertically* or *Split Horizontally* menu option. Figure 8-6, for example, shows the splitter in action with the editor split into three panels:

Figure 8-6

The orientation of a split panel may be changed at any time by right-clicking on the corresponding tab and selecting the *Change Splitter Orientation* menu option. Repeat these steps to unsplit a single panel, this time selecting the *Unsplit* option from the menu. All of the split panels may be removed by right-clicking on any tab and selecting the *Unsplit All* option.

Window splitting may be used to display different files, or to provide multiple windows onto the same file, allowing different areas of the same file to be viewed and edited concurrently.

## 8.3 Code Completion

The Android Studio editor has a considerable amount of built-in knowledge of Kotlin programming syntax and the classes and methods that make up the Android SDK, as well as knowledge of your own code base. As code is typed, the editor scans what is being typed and, where appropriate, makes suggestions with regard to what might be needed to complete a statement or reference. When a completion suggestion is detected by the editor, a panel will appear containing a list of suggestions. In Figure 8-7, for example, the editor is suggesting possibilities for the beginning of a String declaration:

Figure 8-7

If none of the auto completion suggestions are correct, simply keep typing and the editor will continue to refine the suggestions where appropriate. To accept the top most suggestion, simply press the Enter or Tab key on the keyboard. To select a different suggestion, use the arrow keys to move up and down the list, once again using the Enter or Tab key to select the highlighted item.

Completion suggestions can be manually invoked using the *Ctrl-Space* keyboard sequence. This can be useful when changing a word or declaration in the editor. When the cursor is positioned over a word in the editor, that word will automatically highlight. Pressing *Ctrl-Space* will display a list of alternate suggestions. To replace the current word with the currently highlighted item in the suggestion list, simply press the Tab key.

In addition to the real-time auto completion feature, the Android Studio editor also offers a system referred to as *Smart Completion*. Smart completion is invoked using the *Shift-Ctrl-Space* keyboard sequence and, when selected, will provide more detailed suggestions based on the current context of the code. Pressing the *Shift-Ctrl-Space* shortcut sequence a second time will provide more suggestions from a wider range of possibilities.

Code completion can be a matter of personal preference for many programmers. In recognition of this fact, Android Studio provides a high level of control over the auto completion settings. These can be viewed and modified by selecting the *File -> Settings...* menu option (or *Android Studio -> Preferences...* on macOS) and choosing *Editor -> General -> Code Completion* from the settings panel as shown in Figure 8-8:

Figure 8-8

## 8.4 Statement Completion

Another form of auto completion provided by the Android Studio editor is statement completion. This can be used to automatically fill out the parentheses and braces for items such as methods and loop statements. Statement completion is invoked using the *Shift-Ctrl-Enter* (*Shift-Cmd-Enter* on macOS) keyboard sequence. Consider for example the following code:

```
fun myMethod()
```

Having typed this code into the editor, triggering statement completion will cause the editor to automatically add the braces to the method:

```
fun myMethod() {
```

}

## 8.5 Parameter Information

It is also possible to ask the editor to provide information about the argument parameters accepted by a method. With the cursor positioned between the brackets of a method call, the *Ctrl-P* (*Cmd-P* on macOS) keyboard sequence will display the parameters known to be accepted by that method, with the most likely suggestion highlighted in bold:

Figure 8-9

## 8.6 Parameter Name Hints

The code editor may be configured to display parameter name hints within method calls. Figure 8-10, for example, highlights the parameter name hints within the calls to the *make()* and *setAction()* methods of the *Snackbar* class:

Figure 8-10

The settings for this mode may be configured by selecting the *File -> Settings* (*Android Studio -> Preferences* on macOS) menu option followed by *Editor -> Appearance* in the left-hand panel. On the Appearance screen, enable or disable the *Show parameter name hints* option. To adjust the hint settings, click on the *Configure...* button, select the programming language and make any necessary adjustments.

## 8.7 Code Generation

In addition to completing code as it is typed the editor can, under certain conditions, also generate code for you. The list of available code generation options shown in Figure 8-11 can be accessed using the *Alt-Insert* (*Cmd-N* on macOS) keyboard shortcut when the cursor is at the location in the file where the code is to be generated.

Figure 8-11

For the purposes of an example, consider a situation where we want to be notified when an Activity in our project is about to be destroyed by the operating system. As will be outlined in a later chapter of this book, this can be achieved by overriding the `onStop()` lifecycle method of the Activity superclass. To have Android Studio generate a stub method for this, simply select the *Override Methods...* option from the code generation list and select the `onStop()` method from the resulting list of available methods:

Figure 8-12

Having selected the method to override, clicking on *OK* will generate the stub method at the current cursor location in the Kotlin source file as follows:

```
override fun onStop() {
    super.onStop()
}
```

## 8.8 Code Folding

Once a source code file reaches a certain size, even the most carefully formatted and well organized code can become overwhelming and difficult to navigate. Android Studio takes the view that it is not always necessary to have the content of every code block visible at all times. Code navigation can be made easier through the use of the *code folding* feature of the Android Studio editor. Code folding is controlled using markers appearing in the editor gutter at the beginning and end of each block of code in a source file. Figure 8-13, for example, highlights the start and end markers for a method declaration which is not currently folded:

Figure 8-13

## The Basics of the Android Studio Code Editor

Clicking on either of these markers will fold the statement such that only the signature line is visible as shown in Figure 8-14:

Figure 8-14

To unfold a collapsed section of code, simply click on the ‘+’ marker in the editor gutter. To see the hidden code without unfolding it, hover the mouse pointer over the “{...}” indicator as shown in Figure 8-15. The editor will then display the lens overlay containing the folded code block:

Figure 8-15

All of the code blocks in a file may be folded or unfolded using the *Ctrl-Shift-Plus* and *Ctrl-Shift-Minus* keyboard sequences.

By default, the Android Studio editor will automatically fold some code when a source file is opened. To configure the conditions under which this happens, select *File -> Settings...* (*Android Studio -> Preferences...* on macOS) and choose the *Editor -> General -> Code Folding* entry in the resulting settings panel (Figure 8-16):

Figure 8-16

## 8.9 Quick Documentation Lookup

Context sensitive Kotlin and Android documentation can be accessed by placing the cursor over the declaration for which documentation is required and pressing the *Ctrl-Q* keyboard shortcut (*Ctrl-J* on macOS). This will

display a popup containing the relevant reference documentation for the item. Figure 8-17, for example, shows the documentation for the Android Snackbar class.

Figure 8-17

Once displayed, the documentation popup can be moved around the screen as needed. Clicking on the push pin icon located in the right-hand corner of the popup title bar will ensure that the popup remains visible once focus moves back to the editor, leaving the documentation visible as a reference while typing code.

## 8.10 Code Reformatting

In general, the Android Studio editor will automatically format code in terms of indenting, spacing and nesting of statements and code blocks as they are added. In situations where lines of code need to be reformatted (a common occurrence, for example, when cutting and pasting sample code from a web site), the editor provides a source code reformatting feature which, when selected, will automatically reformat code to match the prevailing code style.

To reformat source code, press the *Ctrl-Alt-L* (*Cmd-Opt-L* on macOS) keyboard shortcut sequence. To display the *Reformat Code* dialog (Figure 8-18) use the *Ctrl-Alt-Shift-L* (*Cmd-Opt-Shift-L* on macOS). This dialog provides the option to reformat only the currently selected code, the entire source file currently active in the editor or only code that has changed as the result of a source code control update.

Figure 8-18

The full range of code style preferences can be changed from within the project settings dialog. Select the *File -> Settings* menu option (*Android Studio -> Preferences...* on macOS) and choose *Code Style* in the left-hand panel to access a list of supported programming and markup languages. Selecting a language will provide access to a vast array of formatting style options, all of which may be modified from the Android Studio default to match your preferred code style. To configure the settings for the *Rearrange code* option in the above dialog, for example, unfold the *Code Style* section, select *Kotlin* and, from the *Kotlin* settings, select the *Arrangement* tab.

## 8.11 Finding Sample Code

The Android Studio editor provides a way to access sample code relating to the currently highlighted entry within the code listing. This feature can be useful for learning how a particular Android class or method is used.

## The Basics of the Android Studio Code Editor

To find sample code, highlight a method or class name in the editor, right-click on it and select the *Find Sample Code* menu option. The Find Sample Code panel (Figure 8-19) will appear beneath the editor with a list of matching samples. Selecting a sample from the list will load the corresponding code into the right-hand panel:

Figure 8-19

## 8.12 Summary

The Android Studio editor goes to great length to reduce the amount of typing needed to write code and to make that code easier to read and navigate. In this chapter we have covered a number of the key editor features including code completion, code generation, editor window splitting, code folding, reformatting and documentation lookup.

# Chapter 9

## 9. An Overview of the Android Architecture

So far in this book, steps have been taken to set up an environment suitable for the development of Android applications using Android Studio. An initial step has also been taken into the process of application development through the creation of a simple Android Studio application project.

Before delving further into the practical matters of Android application development, however, it is important to gain an understanding of some of the more abstract concepts of both the Android SDK and Android development in general. Gaining a clear understanding of these concepts now will provide a sound foundation on which to build further knowledge.

Starting with an overview of the Android architecture in this chapter, and continuing in the next few chapters of this book, the goal is to provide a detailed overview of the fundamentals of Android development.

### 9.1 The Android Software Stack

Android is structured in the form of a software stack comprising applications, an operating system, run-time environment, middleware, services and libraries. This architecture can, perhaps, best be represented visually as outlined in Figure 9-1. Each layer of the stack, and the corresponding elements within each layer, are tightly integrated and carefully tuned to provide the optimal application development and execution environment for mobile devices. The remainder of this chapter will work through the different layers of the Android stack, starting at the bottom with the Linux Kernel.

Figure 9-1

## 9.2 The Linux Kernel

Positioned at the bottom of the Android software stack, the Linux Kernel provides a level of abstraction between the device hardware and the upper layers of the Android software stack. Based on Linux version 2.6, the kernel provides preemptive multitasking, low-level core system services such as memory, process and power management in addition to providing a network stack and device drivers for hardware such as the device display, Wi-Fi and audio.

The original Linux kernel was developed in 1991 by Linus Torvalds and was combined with a set of tools, utilities and compilers developed by Richard Stallman at the Free Software Foundation to create a full operating system referred to as GNU/Linux. Various Linux distributions have been derived from these basic underpinnings such as Ubuntu and Red Hat Enterprise Linux.

It is important to note, however, that Android uses only the Linux kernel. That said, it is worth noting that the Linux kernel was originally developed for use in traditional computers in the form of desktops and servers. In fact, Linux is now most widely deployed in mission critical enterprise server environments. It is a testament to both the power of today's mobile devices and the efficiency and performance of the Linux kernel that we find this software at the heart of the Android software stack.

## 9.3 Android Runtime – ART

When an Android app is built within Android Studio it is compiled into an intermediate bytecode format (referred to as DEX format). When the application is subsequently loaded onto the device, the Android Runtime (ART) uses a process referred to as Ahead-of-Time (AOT) compilation to translate the bytecode down to the native instructions required by the device processor. This format is known as Executable and Linkable Format (ELF).

Each time the application is subsequently launched, the ELF executable version is run, resulting in faster application performance and improved battery life.

This contrasts with the Just-in-Time (JIT) compilation approach used in older Android implementations whereby the bytecode was translated within a virtual machine (VM) each time the application was launched.

## 9.4 Android Libraries

In addition to a set of standard Java development libraries (providing support for such general purpose tasks as string handling, networking and file manipulation), the Android development environment also includes the Android Libraries. These are a set of Java-based libraries that are specific to Android development. Examples of libraries in this category include the application framework libraries in addition to those that facilitate user interface building, graphics drawing and database access.

A summary of some key core Android libraries available to the Android developer is as follows:

- **android.app** – Provides access to the application model and is the cornerstone of all Android applications.
- **android.content** – Facilitates content access, publishing and messaging between applications and application components.
- **android.database** – Used to access data published by content providers and includes SQLite database management classes.
- **android.graphics** – A low-level 2D graphics drawing API including colors, points, filters, rectangles and canvases.
- **android.hardware** – Presents an API providing access to hardware such as the accelerometer and light sensor.

- **android.opengl** – A Java interface to the OpenGL ES 3D graphics rendering API.
- **android.os** – Provides applications with access to standard operating system services including messages, system services and inter-process communication.
- **android.media** – Provides classes to enable playback of audio and video.
- **android.net** – A set of APIs providing access to the network stack. Includes *android.net.wifi*, which provides access to the device's wireless stack.
- **android.print** – Includes a set of classes that enable content to be sent to configured printers from within Android applications.
- **android.provider** – A set of convenience classes that provide access to standard Android content provider databases such as those maintained by the calendar and contact applications.
- **android.text** – Used to render and manipulate text on a device display.
- **android.util** – A set of utility classes for performing tasks such as string and number conversion, XML handling and date and time manipulation.
- **android.view** – The fundamental building blocks of application user interfaces.
- **android.widget** - A rich collection of pre-built user interface components such as buttons, labels, list views, layout managers, radio buttons etc.
- **android.webkit** – A set of classes intended to allow web-browsing capabilities to be built into applications.

Having covered the Java-based libraries in the Android runtime, it is now time to turn our attention to the C/C++ based libraries contained in this layer of the Android software stack.

#### 9.4.1 C/C++ Libraries

The Android runtime core libraries outlined in the preceding section are Java-based and provide the primary APIs for developers writing Android applications. It is important to note, however, that the core libraries do not perform much of the actual work and are, in fact, essentially Java “wrappers” around a set of C/C++ based libraries. When making calls, for example, to the *android.opengl* library to draw 3D graphics on the device display, the library actually ultimately makes calls to the OpenGL ES C++ library which, in turn, works with the underlying Linux kernel to perform the drawing tasks.

C/C++ libraries are included to fulfill a wide and diverse range of functions including 2D and 3D graphics drawing, Secure Sockets Layer (SSL) communication, SQLite database management, audio and video playback, bitmap and vector font rendering, display subsystem and graphic layer management and an implementation of the standard C system library (libc).

In practice, the typical Android application developer will access these libraries solely through the Java based Android core library APIs. In the event that direct access to these libraries is needed, this can be achieved using the Android Native Development Kit (NDK), the purpose of which is to call the native methods of non-Java or Kotlin programming languages (such as C and C++) from within Java code using the Java Native Interface (JNI).

### 9.5 Application Framework

The Application Framework is a set of services that collectively form the environment in which Android applications run and are managed. This framework implements the concept that Android applications are constructed from reusable, interchangeable and replaceable components. This concept is taken a step further in that an application is also able to *publish* its capabilities along with any corresponding data so that they can be

## An Overview of the Android Architecture

found and reused by other applications.

The Android framework includes the following key services:

- **Activity Manager** – Controls all aspects of the application lifecycle and activity stack.
- **Content Providers** – Allows applications to publish and share data with other applications.
- **Resource Manager** – Provides access to non-code embedded resources such as strings, color settings and user interface layouts.
- **Notifications Manager** – Allows applications to display alerts and notifications to the user.
- **View System** – An extensible set of views used to create application user interfaces.
- **Package Manager** – The system by which applications are able to find out information about other applications currently installed on the device.
- **Telephony Manager** – Provides information to the application about the telephony services available on the device such as status and subscriber information.
- **Location Manager** – Provides access to the location services allowing an application to receive updates about location changes.

## 9.6 Applications

Located at the top of the Android software stack are the applications. These comprise both the native applications provided with the particular Android implementation (for example web browser and email applications) and the third party applications installed by the user after purchasing the device.

## 9.7 Summary

A good Android development knowledge foundation requires an understanding of the overall architecture of Android. Android is implemented in the form of a software stack architecture consisting of a Linux kernel, a runtime environment and corresponding libraries, an application framework and a set of applications. Applications are predominantly written in Java or Kotlin and compiled down to bytecode format within the Android Studio build environment. When the application is subsequently installed on a device, this bytecode is compiled down by the Android Runtime (ART) to the native format used by the CPU. The key goals of the Android architecture are performance and efficiency, both in application execution and in the implementation of reuse in application design.

# 10. The Anatomy of an Android Application

Regardless of your prior programming experiences, be it Windows, macOS, Linux or even iOS based, the chances are good that Android development is quite unlike anything you have encountered before.

The objective of this chapter, therefore, is to provide an understanding of the high-level concepts behind the architecture of Android applications. In doing so, we will explore in detail both the various components that can be used to construct an application and the mechanisms that allow these to work together to create a cohesive application.

## 10.1 Android Activities

Those familiar with object-oriented programming languages such as Java, Kotlin, C++ or C# will be familiar with the concept of encapsulating elements of application functionality into classes that are then instantiated as objects and manipulated to create an application. Since Android applications are written in Java and Kotlin, this is still very much the case. Android, however, also takes the concept of re-usable components to a higher level.

Android applications are created by bringing together one or more components known as *Activities*. An activity is a single, standalone module of application functionality that usually correlates directly to a single user interface screen and its corresponding functionality. An appointments application might, for example, have an activity screen that displays appointments set up for the current day. The application might also utilize a second activity consisting of a screen where new appointments may be entered by the user.

Activities are intended as fully reusable and interchangeable building blocks that can be shared amongst different applications. An existing email application, for example, might contain an activity specifically for composing and sending an email message. A developer might be writing an application that also has a requirement to send an email message. Rather than develop an email composition activity specifically for the new application, the developer can simply use the activity from the existing email application.

Activities are created as subclasses of the Android *Activity* class and must be implemented so as to be entirely independent of other activities in the application. In other words, a shared activity cannot rely on being called at a known point in a program flow (since other applications may make use of the activity in unanticipated ways) and one activity cannot directly call methods or access instance data of another activity. This, instead, is achieved using *Intents* and *Content Providers*.

By default, an activity cannot return results to the activity from which it was invoked. If this functionality is required, the activity must be specifically started as a *sub-activity* of the originating activity.

## 10.2 Android Fragments

An activity, as described above, typically represents a single user interface screen within an app. One option is to construct the activity using a single user interface layout and one corresponding activity class file. A better alternative, however, is to break the activity into different sections. Each of these sections is referred to as a fragment, each of which consists of part of the user interface layout and a matching class file (declared as a subclass of the Android *Fragment* class). In this scenario, an activity simply becomes a container into which one or more fragments are embedded.

## The Anatomy of an Android Application

In fact, fragments provide an efficient alternative to having each user interface screen represented by a separate activity. Instead, an app can consist of a single activity that switches between different fragments, each representing a different app screen.

### 10.3 Android Intents

Intents are the mechanism by which one activity is able to launch another and implement the flow through the activities that make up an application. Intents consist of a description of the operation to be performed and, optionally, the data on which it is to be performed.

Intents can be *explicit*, in that they request the launch of a specific activity by referencing the activity by class name, or *implicit* by stating either the type of action to be performed or providing data of a specific type on which the action is to be performed. In the case of implicit intents, the Android runtime will select the activity to launch that most closely matches the criteria specified by the Intent using a process referred to as *Intent Resolution*.

### 10.4 Broadcast Intents

Another type of Intent, the *Broadcast Intent*, is a system wide intent that is sent out to all applications that have registered an “interested” *Broadcast Receiver*. The Android system, for example, will typically send out Broadcast Intents to indicate changes in device status such as the completion of system start up, connection of an external power source to the device or the screen being turned on or off.

A Broadcast Intent can be *normal* (asynchronous) in that it is sent to all interested Broadcast Receivers at more or less the same time, or *ordered* in that it is sent to one receiver at a time where it can be processed and then either aborted or allowed to be passed to the next Broadcast Receiver.

### 10.5 Broadcast Receivers

Broadcast Receivers are the mechanism by which applications are able to respond to Broadcast Intents. A Broadcast Receiver must be registered by an application and configured with an *Intent Filter* to indicate the types of broadcast in which it is interested. When a matching intent is broadcast, the receiver will be invoked by the Android runtime regardless of whether the application that registered the receiver is currently running. The receiver then has 5 seconds in which to complete any tasks required of it (such as launching a Service, making data updates or issuing a notification to the user) before returning. Broadcast Receivers operate in the background and do not have a user interface.

### 10.6 Android Services

Android Services are processes that run in the background and do not have a user interface. They can be started and subsequently managed from activities, Broadcast Receivers or other Services. Android Services are ideal for situations where an application needs to continue performing tasks but does not necessarily need a user interface to be visible to the user. Although Services lack a user interface, they can still notify the user of events using notifications and *toasts* (small notification messages that appear on the screen without interrupting the currently visible activity) and are also able to issue Intents.

Services are given a higher priority by the Android runtime than many other processes and will only be terminated as a last resort by the system in order to free up resources. In the event that the runtime does need to kill a Service, however, it will be automatically restarted as soon as adequate resources once again become available. A Service can reduce the risk of termination by declaring itself as needing to run in the *foreground*. This is achieved by making a call to *startForeground()*. This is only recommended for situations where termination would be detrimental to the user experience (for example, if the user is listening to audio being streamed by the Service).

Example situations where a Service might be a practical solution include, as previously mentioned, the streaming

of audio that should continue when the application is no longer active, or a stock market tracking application that needs to notify the user when a share hits a specified price.

## 10.7 Content Providers

Content Providers implement a mechanism for the sharing of data between applications. Any application can provide other applications with access to its underlying data through the implementation of a Content Provider including the ability to add, remove and query the data (subject to permissions). Access to the data is provided via a Universal Resource Identifier (URI) defined by the Content Provider. Data can be shared in the form of a file or an entire SQLite database.

The native Android applications include a number of standard Content Providers allowing applications to access data such as contacts and media files. The Content Providers currently available on an Android system may be located using a *Content Resolver*.

## 10.8 The Application Manifest

The glue that pulls together the various elements that comprise an application is the Application Manifest file. It is within this XML based file that the application outlines the activities, services, broadcast receivers, data providers and permissions that make up the complete application.

## 10.9 Application Resources

In addition to the manifest file and the Dex files that contain the byte code, an Android application package will also typically contain a collection of *resource files*. These files contain resources such as the strings, images, fonts and colors that appear in the user interface together with the XML representation of the user interface layouts. By default, these files are stored in the */res* sub-directory of the application project's hierarchy.

## 10.10 Application Context

When an application is compiled, a class named *R* is created that contains references to the application resources. The application manifest file and these resources combine to create what is known as the *Application Context*. This context, represented by the Android *Context* class, may be used in the application code to gain access to the application resources at runtime. In addition, a wide range of methods may be called on an application's context to gather information and make changes to the application's environment at runtime.

## 10.11 Summary

A number of different elements can be brought together in order to create an Android application. In this chapter, we have provided a high-level overview of Activities, Fragments, Services, Intents and Broadcast Receivers together with an overview of the manifest file and application resources.

Maximum reuse and interoperability are promoted through the creation of individual, standalone modules of functionality in the form of activities and intents, while data sharing between applications is achieved by the implementation of content providers.

While activities are focused on areas where the user interacts with the application (an activity essentially equating to a single user interface screen and often made up of one or more fragments), background processing is typically handled by Services and Broadcast Receivers.

The components that make up the application are outlined for the Android runtime system in a manifest file which, combined with the application's resources, represents the application's context.

Much has been covered in this chapter that is most likely new to the average developer. Rest assured, however, that extensive exploration and practical use of these concepts will be made in subsequent chapters to ensure a solid knowledge foundation on which to build your own applications.

# Chapter 11

## 11. An Introduction to Kotlin

Android development is performed primarily using Android Studio which is, in turn, based on the IntelliJ IDEA development environment created by a company named JetBrains. Prior to the release of Android Studio 3.0, all Android apps were written using Android Studio and the Java programming language (with some occasional C++ code when needed).

Since the introduction of Android Studio 3.0, however, developers now have the option of creating Android apps using another programming language called Kotlin. Although detailed coverage of all features of this language is beyond the scope of this book (entire books can and have been written covering solely Kotlin), the objective of this and the following six chapters is to provide enough information to begin programming in Kotlin and quickly get up to speed developing Android apps using this programming language.

### 11.1 What is Kotlin?

Named after an island located in the Baltic Sea, Kotlin is a programming language created by JetBrains and follows Java in the tradition of naming programming languages after islands. Kotlin code is intended to be easier to understand and write and also safer than many other programming languages. The language, compiler and related tools are all open source and available for free under the Apache 2 license.

The primary goals of the Kotlin language are to make code both concise and safe. Code is generally considered concise when it can be easily read and understood. Conciseness also plays a role when writing code, allowing code to be written more quickly and with greater efficiency. In terms of safety, Kotlin includes a number of features that improve the chances that potential problems will be identified when the code is being written instead of causing runtime crashes.

A third objective in the design and implementation of Kotlin involves interoperability with Java.

### 11.2 Kotlin and Java

Originally introduced by Sun Microsystems in 1995 Java is still by far the most popular programming language in use today. Until the introduction of Kotlin, it is quite likely that every Android app available on the market was written in Java. Since acquiring the Android operating system, Google has invested heavily in tuning and optimizing compilation and runtime environments for running Java-based code on Android devices.

Rather than try to re-invent the wheel, Kotlin is designed to both integrate with and work alongside Java. When Kotlin code is compiled it generates the same bytecode as that generated by the Java compiler enabling projects to be built using a combination of Java and Kotlin code. This compatibility also allows existing Java frameworks and libraries to be used seamlessly from within Kotlin code and also for Kotlin code to be called from within Java.

Kotlin's creators also acknowledged that while there were ways to improve on existing languages, there are many features of Java that did not need to be changed. Consequently, those familiar with programming in Java will find many of these skills to be transferable to Kotlin-based development. Programmers with Swift programming experience will also find much that is familiar when learning Kotlin.

### 11.3 Converting from Java to Kotlin

Given the high level of interoperability between Kotlin and Java it is not essential to convert existing Java code to Kotlin since these two languages will comfortably co-exist within the same project. That being said, Java code

## An Introduction to Kotlin

can be converted to Kotlin from within Android Studio using a built-in Java to Kotlin converter. To convert an entire Java source file to Kotlin, load the file into the Android Studio code editor and select the *Code -> Convert Java File to Kotlin File* menu option. Alternatively, blocks of Java code may be converted to Kotlin by cutting the code and pasting it into an existing Kotlin file within the Android Studio code editor. Note when performing Java to Kotlin conversions that the Java code will not always convert to the best possible Kotlin code and that time should be taken to review and tidy up the code after conversion.

## 11.4 Kotlin and Android Studio

Support for Kotlin is provided within Android Studio via the Kotlin Plug-in which is integrated by default into Android Studio 3.0 or later.

## 11.5 Experimenting with Kotlin

When learning a new programming language, it is often useful to be able to enter and execute snippets of code. One of the best ways to do this with Kotlin is to use the online playground (Figure 11-1) located at <https://try.kotlinlang.org>. In addition to providing an environment in which Kotlin code may be quickly entered and executed, the online playground also includes a set of examples demonstrating key Kotlin features in action.

The panel on the left-hand side (marked A in Figure 11-1) contains a list of coding examples together with any examples you create. Code is typed into the main panel (B) and executed by clicking the Run button (C). Any output from the code execution appears in the console panel (D). Arguments may be passed through to the main function by entering them into the field marked E.

Figure 11-1

Try out some Kotlin code by opening a browser window, navigating to the online playground and entering the following into the main code panel:

```
fun main(args: Array<String>) {
    println("Welcome to Kotlin")

    for (i in 1..8) {
        println("i = $i")
    }
}
```

After entering the code, click on the Run button and note the output in the console panel:

The screenshot shows the Android Studio interface with the Kotlin playground. The code in the editor is the same as above. The console output shows the numbers 1 through 8 printed sequentially. The status bar at the bottom indicates "This demo is running on Kotlin v. 1.1.50".

```
Compilation completed successfully
On-the-fly type checking
Welcome to Kotlin
i = 1
i = 2
i = 3
i = 4
i = 5
i = 6
i = 7
i = 8
```

Problems view    Console    Generated classfiles    This demo is running on Kotlin v. 1.1.50

Figure 11-2

The online playground may also be used to find the Kotlin equivalent for fragments of Java code. Simply enter (or cut and paste) the Java code into the main panel and click on the Convert from Java button (marked E).

## 11.6 Semi-colons in Kotlin

Unlike programming languages such as Java and C++, Kotlin does not require semi-colons at the end of each statement or expression line. The following, therefore, is valid Kotlin code:

```
val mynumber = 10
println(mynumber)
```

Semi-colons are only required when multiple statements appear on the same line:

```
val mynumber = 10; println(mynumber)
```

## 11.7 Summary

For the first time since the Android operating system was introduced, developers now have an alternative to writing apps in Java code. Kotlin is a programming language developed by JetBrains, the company that created the development environment on which Android Studio is based. Kotlin is intended to make code safer and easier to understand and write. Kotlin is also highly compatible with Java, allowing Java and Kotlin code to co-exist within the same projects. This interoperability ensures that most of the standard Java and Java-based Android libraries and frameworks are available for use when developing using Kotlin.

Kotlin support for Android Studio is provided via a plug-in bundled with Android Studio 3.0 or later. This plug-in also provides a converter to translate Java code to Kotlin.

When learning Kotlin, the online playground provides a useful environment for quickly trying out Kotlin code.

## 12. Kotlin Data Types, Variables and Nullability

Both this and the following few chapters are intended to introduce the basics of the Kotlin programming language. This chapter will focus on the various data types available for use within Kotlin code. This will also include an explanation of constants, variables, type casting and Kotlin's handling of null values.

As outlined in the previous chapter, entitled “*An Introduction to Kotlin*” a useful way to experiment with the language is to use the Kotlin online playground environment. Before starting this chapter, therefore, open a browser window, navigate to <https://try.kotlin.in> and use the playground to try out the code in both this and the other Kotlin introductory chapters that follow.

### 12.1 Kotlin Data Types

When we look at the different types of software that run on computer systems and mobile devices, from financial applications to graphics intensive games, it is easy to forget that computers are really just binary machines. Binary systems work in terms of 0 and 1, true or false, set and unset. All the data sitting in RAM, stored on disk drives and flowing through circuit boards and buses are nothing more than sequences of 1s and 0s. Each 1 or 0 is referred to as a bit and bits are grouped together in blocks of 8, each group being referred to as a byte. When people talk about 32-bit and 64-bit computer systems they are talking about the number of bits that can be handled simultaneously by the CPU bus. A 64-bit CPU, for example, is able to handle data in 64-bit blocks, resulting in faster performance than a 32-bit based system.

Humans, of course, don't think in binary. We work with decimal numbers, letters and words. In order for a human to easily ('easily' being a relative term in this context) program a computer, some middle ground between human and computer thinking is needed. This is where programming languages such as Kotlin come into play. Programming languages allow humans to express instructions to a computer in terms and structures we understand, and then compile that down to a format that can be executed by a CPU.

One of the fundamentals of any program involves data, and programming languages such as Kotlin define a set of *data types* that allow us to work with data in a format we understand when programming. For example, if we want to store a number in a Kotlin program we could do so with syntax similar to the following:

```
val mynumber = 10
```

In the above example, we have created a variable named *mynumber* and then assigned to it the value of 10. When we compile the source code down to the machine code used by the CPU, the number 10 is seen by the computer in binary as:

```
1010
```

Similarly, we can express a letter, the visual representation of a digit ('0' through to '9') or punctuation mark (referred to in computer terminology as *characters*) using the following syntax:

```
val myletter = 'c'
```

Once again, this is understandable by a human programmer, but gets compiled down to a binary sequence for the CPU to understand. In this case, the letter 'c' is represented by the decimal number 99 using the ASCII table (an internationally recognized standard that assigns numeric values to human readable characters). When

## Kotlin Data Types, Variables and Nullability

converted to binary, it is stored as:

10101100011

Now that we have a basic understanding of the concept of data types and why they are necessary we can take a closer look at some of the more commonly used data types supported by Kotlin.

### 12.1.1 Integer Data Types

Kotlin integer data types are used to store whole numbers (in other words a number with no decimal places). All integers in Kotlin are signed (in other words capable of storing positive, negative and zero values).

Kotlin provides support for 8, 16, 32 and 64 bit integers (represented by the Byte, Short, Int and Long types respectively).

### 12.1.2 Floating Point Data Types

The Kotlin floating point data types are able to store values containing decimal places. For example, 4353.1223 would be stored in a floating point data type. Kotlin provides two floating point data types in the form of Float and Double. Which type to use depends on the size of value to be stored and the level of precision required. The Double type can be used to store up to 64-bit floating point numbers. The Float data type, on the other hand, is limited to 32-bit floating point numbers.

### 12.1.3 Boolean Data Type

Kotlin, like other languages, includes a data type for the purpose of handling true or false (1 or 0) conditions. Two Boolean constant values (*true* and *false*) are provided by Kotlin specifically for working with Boolean data types.

### 12.1.4 Character Data Type

The Kotlin Char data type is used to store a single character of rendered text such as a letter, numerical digit, punctuation mark or symbol. Internally characters in Kotlin are stored in the form of 16-bit Unicode grapheme clusters. A grapheme cluster is made of two or more Unicode code points that are combined to represent a single visible character.

The following lines assign a variety of different characters to Character type variables:

```
val myChar1 = 'f'  
val myChar2 = ':'  
val myChar3 = 'X'
```

Characters may also be referenced using Unicode code points. The following example assigns the 'X' character to a variable using Unicode:

```
val myChar4 = '\u0058'
```

Note the use of single quotes when assigning a character to a variable. This indicates to Kotlin that this is a Char data type as opposed to double quotes which indicate a String data type.

### 12.1.5 String Data Type

The String data type is a sequence of characters that typically make up a word or sentence. In addition to providing a storage mechanism, the String data type also includes a range of string manipulation features allowing strings to be searched, matched, concatenated and modified. Double quotes are used to surround single line strings during assignment, for example:

```
val message = "You have 10 new messages."
```

Alternatively, a multi-line string may be declared using triple quotes

```
val message = """You have 10 new messages,
                  5 old messages
                  and 6 spam messages."""
```

The leading spaces on each line of a multi-line string can be removed by making a call to the `trimMargin()` function of the String data type:

```
val message = """You have 10 new messages,
                  5 old messages
                  and 6 spam messages.""".trimMargin()
```

Strings can also be constructed using combinations of strings, variables, constants, expressions, and function calls using a concept referred to as string interpolation. For example, the following code creates a new string from a variety of different sources using string interpolation before outputting it to the console:

```
val username = "John"
val inboxCount = 25
val maxcount = 100
val message = "$username has $inboxCount message. Message capacity remaining is
${maxcount - inboxCount}"

println(message)
```

When executed, the code will output the following message:

```
John has 25 messages. Message capacity remaining is 75 messages.
```

### 12.1.6 Escape Sequences

In addition to the standard set of characters outlined above, there is also a range of special characters (also referred to as escape characters) available for specifying items such as a new line, tab or a specific Unicode value within a string. These special characters are identified by prefixing the character with a backslash (a concept referred to as escaping). For example, the following assigns a new line to the variable named newline:

```
var newline = '\n'
```

In essence, any character that is preceded by a backslash is considered to be a special character and is treated accordingly. This raises the question as to what to do if you actually want a backslash character. This is achieved by escaping the backslash itself:

```
var backslash = '\\\'
```

The complete list of special characters supported by Kotlin is as follows:

- \n - New line
- \r - Carriage return
- \t - Horizontal tab
- \\ - Backslash
- \" - Double quote (used when placing a double quote into a string declaration)
- \' - Single quote (used when placing a single quote into a string declaration)
- \\$ - Used when a character sequence containing a \$ is misinterpreted as a variable in a string template.
- \unnnn – Double byte Unicode scalar where nnnn is replaced by four hexadecimal digits representing the

Unicode character.

## 12.2 Mutable Variables

Variables are essentially locations in computer memory reserved for storing the data used by an application. Each variable is given a name by the programmer and assigned a value. The name assigned to the variable may then be used in the Kotlin code to access the value assigned to that variable. This access can involve either reading the value of the variable or, in the case of *mutable variables*, changing the value.

## 12.3 Immutable Variables

Often referred to as a *constant*, an immutable variable is similar to a mutable variable in that it provides a named location in memory to store a data value. Immutable variables differ in one significant way in that once a value has been assigned it cannot subsequently be changed.

Immutable variables are particularly useful if there is a value which is used repeatedly throughout the application code. Rather than use the value each time, it makes the code easier to read if the value is first assigned to a constant which is then referenced in the code. For example, it might not be clear to someone reading your Kotlin code why you used the value 5 in an expression. If, instead of the value 5, you use an immutable variable named *interestRate* the purpose of the value becomes much clearer. Immutable values also have the advantage that if the programmer needs to change a widely used value, it only needs to be changed once in the constant declaration and not each time it is referenced.

## 12.4 Declaring Mutable and Immutable Variables

Mutable variables are declared using the *var* keyword and may be initialized with a value at creation time. For example:

```
var userCount = 10
```

If the variable is declared without an initial value, the type of the variable must also be declared (a topic which will be covered in more detail in the next section of this chapter). The following, for example, is a typical declaration where the variable is initialized after it has been declared:

```
var userCount: Int  
userCount = 42
```

Immutable variables are declared using the *val* keyword.

```
val maxUserCount = 20
```

As with mutable variables, the type must also be specified when declaring the variable without initializing it:

```
val maxUserCount: Int  
maxUserCount = 20
```

When writing Kotlin code, immutable variables should always be used in preference to mutable variables whenever possible.

## 12.5 Data Types are Objects

All of the above data types are actually objects, each of which provides a range of functions and properties that may be used to perform a variety of different type specific tasks. These functions and properties are accessed using so-called dot notation. Dot notation involves accessing a function or property of an object by specifying the variable name followed by a dot followed in turn by the name of the property to be accessed or function to be called.

A string variable, for example, can be converted to uppercase via a call to the *toUpperCase()* function of the String class:

```
val myString = "The quick brown fox"
val uppercase = myString.toUpperCase()
```

Similarly, the length of a string is available by accessing the length property:

```
val length = myString.length
```

Functions are also available within the String class to perform tasks such as comparisons and checking for the presence of a specific word. The following code, for example, will return a *true* Boolean value since the word "fox" appears within the string assigned to the *myString* variable:

```
val result = myString.contains("fox")
```

All of the number data types include functions for performing tasks such as converting from one data type to another such as converting an Int to a Float:

```
val myInt = 10
val myFloat = myInt.toFloat()
```

A detailed overview of all of the properties and functions provided by the Kotlin data type classes is beyond the scope of this book (there are hundreds). An exhaustive list for all data types can, however, be found within the Kotlin reference documentation available online at:

<https://kotlinlang.org/api/latest/jvm/stdlib/kotlin/>

## 12.6 Type Annotations and Type Inference

Kotlin is categorized as a statically typed programming language. This essentially means that once the data type of a variable has been identified, that variable cannot subsequently be used to store data of any other type without inducing a compilation error. This contrasts to loosely typed programming languages where a variable, once declared, can subsequently be used to store other data types.

There are two ways in which the type of a variable will be identified. One approach is to use a type annotation at the point the variable is declared in the code. This is achieved by placing a colon after the variable name followed by the type declaration. The following line of code, for example, declares a variable named *userCount* as being of type Int:

```
val userCount: Int = 10
```

In the absence of a type annotation in a declaration, the Kotlin compiler uses a technique referred to as *type inference* to identify the type of the variable. When relying on type inference, the compiler looks to see what type of value is being assigned to the variable at the point that it is initialized and uses that as the type. Consider, for example, the following variable declarations:

```
var signalStrength = 2.231
val companyName = "My Company"
```

During compilation of the above lines of code, Kotlin will infer that the *signalStrength* variable is of type Double (type inference in Kotlin defaults to Double for all floating point numbers) and that the *companyName* constant is of type String.

When a constant is declared without a type annotation it must be assigned a value at the point of declaration:

```
val bookTitle = "Android Studio Development Essentials"
```

If a type annotation is used when the constant is declared, however, the value can be assigned later in the code. For example:

```
val iosBookType = false
val bookTitle: String
```

```
if (iosBookType) {
    bookTitle = "iOS App Development Essentials"
} else {
    bookTitle = "Android Studio Development Essentials"
}
```

## 12.7 Nullable Type

Kotlin nullable types are a concept that does not exist in most other programming languages (with the exception of the *optional* type in Swift). The purpose of nullable types is to provide a safe and consistent approach to handling situations where a variable may have a null value assigned to it. In other words, the objective is to avoid the common problem of code crashing with the null pointer exception errors that occur when code encounters a null value where one was not expected.

By default, a variable in Kotlin cannot have a null value assigned to it. Consider, for example, the following code:

```
val username: String = null
```

An attempt to compile the above code will result in a compilation error similar to the following:

```
Error: Null cannot be a value of a non-null string type String
```

If a variable is required to be able to store a null value, it must be specifically declared as a nullable type by placing a question mark (?) after the type declaration:

```
val username: String? = null
```

The *username* variable can now have a null value assigned to it without triggering a compiler error. Once a variable has been declared as nullable, a range of restrictions are then imposed on that variable by the compiler to prevent it being used in situations where it might cause a null pointer exception to occur. A nullable variable, cannot, for example, be assigned to a variable of non-null type as is the case in the following code:

```
val username: String? = null
val firstname: String = username
```

The above code will elicit the following error when encountered by the compiler:

```
Error: Type mismatch: inferred type is String? but String was expected
```

The only way that the assignment will be permitted is if some code is added to check that the value assigned to the nullable variable is non-null:

```
val username: String? = null
```

```
if (username != null) {
    val firstname: String = username
}
```

In the above case, the assignment will only take place if the *username* variable references a non-null value.

## 12.8 The Safe Call Operator

A nullable variable also cannot be used to call a function or to access a property in the usual way. Earlier in this chapter the *toUpperCase()* function was called on a String object. Given the possibility that this could cause a function to be called on a null reference, the following code will be disallowed by the compiler:

```
val username: String? = null
val uppercase = username.toUpperCase()
```

The exact error message generated by the compiler in this situation reads as follows:

```
Error: (Only safe (?.) or non-null asserted (!!.) calls are allowed on a nullable receiver of type String?)
```

In this instance, the compiler is essentially refusing to allow the function call to be made because no attempt has been made to verify that the variable is non-null. One way around this is to add some code to verify that something other than null value has been assigned to the variable prior to making the function call:

```
if (username != null) {
    val uppercase = username.toUpperCase()
}
```

A much more efficient way to achieve this same verification, however, is to call the function using the *safe call operator* (represented by `?`) as follows:

```
val uppercase = username?.toUpperCase()
```

In the above example, if the `username` variable is null, the `toUpperCase()` function will not be called and execution will proceed at the next line of code. If, on the other hand, a non-null value is assigned the `toUpperCase()` function will be called and the result assigned to the `uppercase` variable.

In addition to function calls, the safe call operator may also be used when accessing properties:

```
val uppercase = username?.length
```

## 12.9 Not-Null Assertion

The *not-null assertion* removes all of the compiler restrictions from a nullable type, allowing it to be used in the same ways as a non-null type, even if it has been assigned a null value. This assertion is implemented using double exclamation marks after the variable name, for example:

```
val username: String? = null
val length = username!! .length
```

The above code will now compile, but will crash with the following exception at runtime since an attempt is being made to call a function on a non-existent object:

```
Exception in thread "main" kotlin.NullPointerException
```

Clearly, this causes the very issue that nullable types are designed to avoid. Use of the not-null assertion is generally discouraged and should only be used in situations where you are certain that the value will not be null.

## 12.10 Nullable Types and the let Function

Earlier in this chapter we looked at how the safe call operator can be used when making a call to a function belonging to a nullable type. This technique makes it easier to check if a value is null without having to write an `if` statement every time the variable is accessed. A similar problem occurs when passing a nullable type as an argument to a function which is expecting a non-null parameter. As an example, consider the `times()` function of the `Int` data type. When called on an `Int` object and passed another integer value as an argument, the function multiplies the two values and returns the result. When the following code is executed, for example, the value of 200 will be displayed within the console:

```
val firstNumber = 10
val secondNumber = 20

val result = firstNumber.times(secondNumber)
print(result)
```

The above example works because the `secondNumber` variable is a non-null type. A problem, however, occurs if

## Kotlin Data Types, Variables and Nullability

the secondNumber variable is declared as being of nullable type:

```
val firstNumber = 10
val secondNumber: Int? = 20

val result = firstNumber.times(secondNumber)
print(result)
```

Now the compilation will fail with the following error message because a nullable type is being passed to a function that is expecting a non-null parameter:

```
Error: Type mismatch: inferred type is Int? but Int was expected
```

A possible solution to this problem is to simply write an *if* statement to verify that the value assigned to the variable is non-null before making the call to the function:

```
val firstNumber = 10
val secondNumber: Int? = 20

if (secondNumber != null) {
    val result = firstNumber.times(secondNumber)
    print(result)
}
```

A more convenient approach to addressing the issue, however, involves use of the *let* function. When called on a nullable type object, the let function converts the nullable type to a non-null variable named *it* which may then be referenced within a lambda statement.

```
secondNumber?.let {
    val result = firstNumber.times(it)
    print(result)
}
```

Note the use of the safe call operator when calling the *let* function on secondVariable in the above example. This ensures that the function is only called when the variable is assigned a non-null value.

### 12.11 Late Initialization (lateinit)

As previously outlined, non-null types need to be initialized when they are declared. This can be inconvenient if the value to be assigned to the non-null variable will not be known until later in the code execution. One way around this is to declare the variable using the *lateinit* modifier. This modifier designates that a value will be initialized with a value later. This has the advantage that a non-null type can be declared before it is initialized, with the disadvantage that the programmer is responsible for ensuring that the initialization has been performed before attempting to access the variable. Consider the following variable declaration:

```
var myName: String
```

Clearly, this is invalid since the variable is a non-null type but has not been assigned a value. Suppose, however, that the value to be assigned to the variable will not be known until later in the program execution. In this case, the *lateinit* modifier can be used as follows:

```
lateinit var myName: String
```

With the variable declared in this way, the value can be assigned later, for example:

```
myName = "John Smith"
print("My Name is " + myName)
```

Of course, if the variable is accessed before it is initialized, the code will fail with an exception:

```
lateinit var myName: String

print("My Name is " + myName)
```

```
Exception in thread "main" kotlin.UninitializedPropertyAccessException: lateinit
property myName has not been initialized
```

To verify whether a lateinit variable has been initialized, check the *isInitialized* property on the variable. To do this, we need to access the properties of the variable by prefixing the name with the '::' operator:

```
if (::myName.isInitialized) {
    print("My Name is " + myName)
}
```

## 12.12 The Elvis Operator

The Kotlin Elvis operator can be used in conjunction with nullable types to define a default value that is to be returned in the event that a value or expression result is null. The Elvis operator (?:) is used to separate two expressions. If the expression on the left does not resolve to a null value that value is returned, otherwise the result of the rightmost expression is returned. This can be thought of as a quick alternative to writing an if-else statement to check for a null value. Consider the following code:

```
if (myString != null) {
    return myString
} else {
    return "String is null"
}
```

The same result can be achieved with less coding using the Elvis operator as follows:

```
return myString ?: "String is null"
```

## 12.13 Type Casting and Type Checking

When compiling Kotlin code, the compiler can typically infer the type of an object. Situations will occur, however, where the compiler is unable to identify the specific type. This is often the case when a value type is ambiguous or an unspecified object is returned from a function call. In this situation it may be necessary to let the compiler know the type of object that your code is expecting or to write code that checks whether the object is of a particular type.

Letting the compiler know the type of object that is expected is known as *type casting* and is achieved within Kotlin code using the *as* cast operator. The following code, for example, lets the compiler know that the result returned from the *getSystemService()* method needs to be treated as a KeyguardManager object:

```
val keyMgr = getSystemService(Context.KEYGUARD_SERVICE) as KeyguardManager
```

The Kotlin language includes both safe and unsafe cast operators. The above cast is an unsafe cast and will cause the app to throw an exception if the cast cannot be performed. A safe cast, on the other hand, uses the *as?* operator and returns null if the cast cannot be performed:

```
val keyMgr = getSystemService(Context.KEYGUARD_SERVICE) as? KeyguardManager
```

A type check can be performed to verify that an object conforms to a specific type using the *is* operator, for example:

```
if (keyMgr is KeyguardManager) {
```

```
// It is a KeyguardManager object  
}
```

### 12.14 Summary

This chapter has begun the introduction to Kotlin by exploring data types together with an overview of how to declare variables. The chapter has also introduced concepts such as nullable types, type casting and type checking and the Elvis operator, each of which is an integral part of Kotlin programming and designed specifically to make code writing less prone to error.

# Chapter 13

## 13. Kotlin Operators and Expressions

So far we have looked at using variables and constants in Kotlin and also described the different data types. Being able to create variables is only part of the story however. The next step is to learn how to use these variables in Kotlin code. The primary method for working with data is in the form of *expressions*.

### 13.1 Expression Syntax in Kotlin

The most basic expression consists of an *operator*, two *operands* and an *assignment*. The following is an example of an expression:

```
val myresult = 1 + 2
```

In the above example, the (+) operator is used to add two operands (1 and 2) together. The *assignment operator* (=) subsequently assigns the result of the addition to a variable named *myresult*. The operands could just have easily been variables (or a mixture of values and variables) instead of the actual numerical values used in the example.

In the remainder of this chapter we will look at the basic types of operators available in Kotlin.

### 13.2 The Basic Assignment Operator

We have already looked at the most basic of assignment operators, the = operator. This assignment operator simply assigns the result of an expression to a variable. In essence, the = assignment operator takes two operands. The left-hand operand is the variable to which a value is to be assigned and the right-hand operand is the value to be assigned. The right-hand operand is, more often than not, an expression which performs some type of arithmetic or logical evaluation or a call to a function, the result of which will be assigned to the variable. The following examples are all valid uses of the assignment operator:

```
var x: Int // Declare a mutable Int variable
val y = 10 // Declare and initialize an immutable Int variable

x = 10 // Assign a value to x
x = x + y // Assign the result of x + y to x
x = y // Assign the value of y to x
```

### 13.3 Kotlin Arithmetic Operators

Kotlin provides a range of operators for the purpose of creating mathematical expressions. These operators primarily fall into the category of *binary operators* in that they take two operands. The exception is the *unary negative operator* (-) which serves to indicate that a value is negative rather than positive. This contrasts with the *subtraction operator* (-) which takes two operands (i.e. one value to be subtracted from another). For example:

```
var x = -10 // Unary - operator used to assign -10 to variable x
x = x - 5 // Subtraction operator. Subtracts 5 from x
```

The following table lists the primary Kotlin arithmetic operators:

Operator	Description
- (unary)	Negates the value of a variable or expression
*	Multiplication

/	Division
+	Addition
-	Subtraction
%	Remainder/Modulo

Table 13-1

Note that multiple operators may be used in a single expression.

For example:

```
x = y * 10 + z - 5 / 4
```

## 13.4 Augmented Assignment Operators

In an earlier section we looked at the basic assignment operator (`=`). Kotlin provides a number of operators designed to combine an assignment with a mathematical or logical operation. These are primarily of use when performing an evaluation where the result is to be stored in one of the operands. For example, one might write an expression as follows:

```
x = x + y
```

The above expression adds the value contained in variable `x` to the value contained in variable `y` and stores the result in variable `x`. This can be simplified using the addition augmented assignment operator:

```
x += y
```

The above expression performs exactly the same task as `x = x + y` but saves the programmer some typing.

Numerous augmented assignment operators are available in Kotlin. The most frequently used of which are outlined in the following table:

Operator	Description
<code>x += y</code>	Add <code>x</code> to <code>y</code> and place result in <code>x</code>
<code>x -= y</code>	Subtract <code>y</code> from <code>x</code> and place result in <code>x</code>
<code>x *= y</code>	Multiply <code>x</code> by <code>y</code> and place result in <code>x</code>
<code>x /= y</code>	Divide <code>x</code> by <code>y</code> and place result in <code>x</code>
<code>x %= y</code>	Perform Modulo on <code>x</code> and <code>y</code> and place result in <code>x</code>

Table 13-1

## 13.5 Increment and Decrement Operators

Another useful shortcut can be achieved using the Kotlin increment and decrement operators (also referred to as unary operators because they operate on a single operand). Consider the code fragment below:

```
x = x + 1 // Increase value of variable x by 1
x = x - 1 // Decrease value of variable x by 1
```

These expressions increment and decrement the value of `x` by 1. Instead of using this approach, however, it is quicker to use the `++` and `--` operators. The following examples perform exactly the same tasks as the examples above:

```
x++ // Increment x by 1
x-- // Decrement x by 1
```

These operators can be placed either before or after the variable name. If the operator is placed before the

variable name, the increment or decrement operation is performed before any other operations are performed on the variable. For example, in the following code, x is incremented before it is assigned to y, leaving y with a value of 10:

```
var x = 9
val y = ++x
```

In the next example, however, the value of x (9) is assigned to variable y before the decrement is performed. After the expression is evaluated the value of y will be 9 and the value of x will be 8.

```
var x = 9
val y = x--
```

## 13.6 Equality Operators

Kotlin also includes a set of logical operators useful for performing comparisons. These operators all return a Boolean result depending on the result of the comparison. These operators are *binary operators* in that they work with two operands.

Equality operators are most frequently used in constructing program flow control logic. For example an *if* statement may be constructed based on whether one value matches another:

```
if x == y {
    // Perform task
}
```

The result of a comparison may also be stored in a Boolean variable. For example, the following code will result in a *true* value being stored in the variable *result*:

```
var result: Bool
val x = 10
val y = 20

result = x < y
```

Clearly 10 is less than 20, resulting in a *true* evaluation of the *x < y* expression. The following table lists the full set of Kotlin comparison operators:

Operator	Description
<i>x == y</i>	Returns true if x is equal to y
<i>x &gt; y</i>	Returns true if x is greater than y
<i>x &gt;= y</i>	Returns true if x is greater than or equal to y
<i>x &lt; y</i>	Returns true if x is less than y
<i>x &lt;= y</i>	Returns true if x is less than or equal to y
<i>x != y</i>	Returns true if x is not equal to y

Table 13-1

## 13.7 Boolean Logical Operators

Kotlin also provides a set of so called logical operators designed to return Boolean *true* or *false* values. These operators both return Boolean results and take Boolean values as operands. The key operators are NOT (!), AND (&&) and OR (||).

The NOT (!) operator simply inverts the current value of a Boolean variable, or the result of an expression. For

## Kotlin Operators and Expressions

example, if a variable named *flag* is currently true, prefixing the variable with a ‘!’ character will invert the value to false:

```
val flag = true // variable is true
val secondFlag = !flag // secondFlag set to false
```

The OR (||) operator returns true if one of its two operands evaluates to true, otherwise it returns false. For example, the following code evaluates to true because at least one of the expressions either side of the OR operator is true:

```
if ((10 < 20) || (20 < 10)) {
    print("Expression is true")
}
```

The AND (&&) operator returns true only if both operands evaluate to be true. The following example will return false because only one of the two operand expressions evaluates to true:

```
if ((10 < 20) && (20 < 10)) {
    print("Expression is true")
}
```

## 13.8 Range Operator

Kotlin includes a useful operator that allows a range of values to be declared. As will be seen in later chapters, this operator is invaluable when working with looping in program logic.

The syntax for the range operator is as follows:

x..y

This operator represents the range of numbers starting at x and ending at y where both x and y are included within the range (referred to as a closed range). The range operator 5..8, for example, specifies the numbers 5, 6, 7 and 8.

## 13.9 Bitwise Operators

As previously discussed, computer processors work in binary. These are essentially streams of ones and zeros, each one referred to as a bit. Bits are formed into groups of 8 to form bytes. As such, it is not surprising that we, as programmers, will occasionally end up working at this level in our code. To facilitate this requirement, Kotlin provides a range of *bit operators*.

Those familiar with bitwise operators in other languages such as C, C++, C#, Objective-C and Java will find nothing new in this area of the Kotlin language syntax. For those unfamiliar with binary numbers, now may be a good time to seek out reference materials on the subject in order to understand how ones and zeros are formed into bytes to form numbers. Other authors have done a much better job of describing the subject than we can do within the scope of this book.

For the purposes of this exercise we will be working with the binary representation of two numbers. First, the decimal number 171 is represented in binary as:

10101011

Second, the number 3 is represented by the following binary sequence:

00000011

Now that we have two binary numbers with which to work, we can begin to look at the Kotlin bitwise operators:

### 13.9.1 Bitwise Inversion

The Bitwise inversion (also referred to as NOT) is performed using the *inv()* operation and has the effect of inverting all of the bits in a number. In other words, all the zeros become ones and all the ones become zeros. Taking our example 3 number, a Bitwise NOT operation has the following result:

```
00000011 NOT
=====
11111100
```

The following Kotlin code, therefore, results in a value of -4:

```
val y = 3
val z = y.inv()

print("Result is $z")
```

### 13.9.2 Bitwise AND

The Bitwise AND is performed using the *and()* operation. It makes a bit by bit comparison of two numbers. Any corresponding position in the binary sequence of each number where both bits are 1 results in a 1 appearing in the same position of the resulting number. If either bit position contains a 0 then a zero appears in the result. Taking our two example numbers, this would appear as follows:

```
10101011 AND
00000011
=====
00000011
```

As we can see, the only locations where both numbers have 1s are the last two positions. If we perform this in Kotlin code, therefore, we should find that the result is 3 (00000011):

```
val x = 171
val y = 3
val z = x.and(y)

print("Result is $z")
```

### 13.9.3 Bitwise OR

The bitwise OR also performs a bit by bit comparison of two binary sequences. Unlike the AND operation, the OR places a 1 in the result if there is a 1 in the first or second operand. Using our example numbers, the result will be as follows:

```
10101011 OR
00000011
=====
10101011
```

If we perform this operation in Kotlin using the *or()* operation the result will be 171:

```
val x = 171
val y = 3
val z = x.or(y)

print("Result is $z")
```

### 13.9.4 Bitwise XOR

The bitwise XOR (commonly referred to as *exclusive OR* and performed using the `xor()` operation) performs a similar task to the OR operation except that a 1 is placed in the result if one or other corresponding bit positions in the two numbers is 1. If both positions are a 1 or a 0 then the corresponding bit in the result is set to a 0. For example:

```
10101011 XOR
00000011
=====
10101000
```

The result in this case is 10101000 which converts to 168 in decimal. To verify this we can, once again, try some Kotlin code:

```
val x = 171
val y = 3
val z = x.xor(y)

print("Result is $z")
```

When executed, we get the following output from print:

```
Result is 168
```

### 13.9.5 Bitwise Left Shift

The bitwise left shift moves each bit in a binary number a specified number of positions to the left. Shifting an integer one position to the left has the effect of doubling the value.

As the bits are shifted to the left, zeros are placed in the vacated right most (low order) positions. Note also that once the left most (high order) bits are shifted beyond the size of the variable containing the value, those high order bits are discarded:

```
10101011 Left Shift one bit
=====
101010110
```

In Kotlin the bitwise left shift operator is performed using the `shl()` operation, passing through the number of bit positions to be shifted. For example, to shift left by 1 bit:

```
val x = 171
val z = x.shl(1)

print("Result is $z")
```

When compiled and executed, the above code will display a message stating that the result is 342 which, when converted to binary, equates to 101010110.

### 13.9.6 Bitwise Right Shift

A bitwise right shift is, as you might expect, the same as a left except that the shift takes place in the opposite direction. Shifting an integer one position to the right has the effect of halving the value.

Note that since we are shifting to the right there is no opportunity to retain the lower most bits regardless of the data type used to contain the result. As a result the low order bits are discarded. Whether or not the vacated high order bit positions are replaced with zeros or ones depends on whether the *sign bit* used to indicate positive and negative numbers is set or not.

```
10101011 Right Shift one bit
```

```
=====
```

```
01010101
```

The bitwise right shift is performed using the *shr()* operation passing through the shift count:

```
val x = 171  
val z = x.shr(1)
```

```
print("Result is $z")
```

When executed, the above code will report the result of the shift as being 85, which equates to binary 01010101.

## 13.10 Summary

Operators and expressions provide the underlying mechanism by which variables and constants are manipulated and evaluated within Kotlin code. This can take the simplest of forms whereby two numbers are added using the addition operator in an expression and the result stored in a variable using the assignment operator. Operators fall into a range of categories, details of which have been covered in this chapter.

## 14. Kotlin Flow Control

Regardless of the programming language used, application development is largely an exercise in applying logic, and much of the art of programming involves writing code that makes decisions based on one or more criteria. Such decisions define which code gets executed, how many times it is executed and, conversely, which code gets by-passed when the program is executing. This is often referred to as *flow control* since it controls the *flow* of program execution. Flow control typically falls into the categories of *looping control* (how often code is executed) and *conditional flow control* (whether or not code is executed). This chapter is intended to provide an introductory overview of both types of flow control in Kotlin.

### 14.1 Looping Flow Control

This chapter will begin by looking at flow control in the form of loops. Loops are essentially sequences of Kotlin statements which are to be executed repeatedly until a specified condition is met. The first looping statement we will explore is the *for* loop.

#### 14.1.1 The Kotlin *for-in* Statement

The for-in loop is used to iterate over a sequence of items contained in a collection or number range.

The syntax of the for-in loop is as follows:

```
for variable name in collection or range {  
    // code to be executed  
}
```

In this syntax, *variable name* is the name to be used for a variable that will contain the current item from the collection or range through which the loop is iterating. The code in the body of the loop will typically use this name as a reference to the current item in the loop cycle. The *collection or range* references the item through which the loop is iterating. This could, for example, be an array of string values, a range operator or even a string of characters.

Consider, for example, the following for-in loop construct:

```
for (index in 1..5) {  
    println("Value of index is $index")  
}
```

The loop begins by stating that the current item is to be assigned to a constant named *index*. The statement then declares a closed range operator to indicate that the for loop is to iterate through a range of numbers, starting at 1 and ending at 5. The body of the loop simply prints out a message to the console indicating the current value assigned to the *index* constant, resulting in the following output:

```
Value of index is 1  
Value of index is 2  
Value of index is 3  
Value of index is 4  
Value of index is 5
```

The for-in loop is of particular benefit when working with collections such as arrays. In fact, the for-in loop can be used to iterate through any object that contains more than one item. The following loop, for example, outputs

## Kotlin Flow Control

each of the characters in the specified string:

```
for (index in "Hello") {  
    println("Value of index is $index")  
}
```

The operation of a for-in loop may be configured using the *downTo* and *until* functions. The *downTo* function causes the for loop to work backwards through the specified collection until the specified number is reached. The following for loop counts backwards from 100 until the number 90 is reached:

```
for (index in 100 downTo 90) {  
    print("$index.. ")  
}
```

When executed, the above loop will generate the following output:

```
100.. 99.. 98.. 97.. 96.. 95.. 94.. 93.. 92.. 91.. 90..
```

The *until* function operates in much the same way with the exception that counting starts from the bottom of the collection range and works up until (but not including) the specified end point (a concept referred to as a half closed range):

```
for (index in 1 until 10) {  
    print("$index.. ")  
}
```

The output from the above code will range from the start value of 1 through to 9:

```
1.. 2.. 3.. 4.. 5.. 6.. 7.. 8.. 9..
```

The increment used on each iteration through the loop may also be defined using the *step* function as follows:

```
for (index in 0 until 100 step 10) {  
    print("$index.. ")  
}
```

The above code will result in the following console output:

```
0.. 10.. 20.. 30.. 40.. 50.. 60.. 70.. 80.. 90..
```

### 14.1.2 The *while* Loop

The Kotlin *for* loop described previously works well when it is known in advance how many times a particular task needs to be repeated in a program. There will, however, be instances where code needs to be repeated until a certain condition is met, with no way of knowing in advance how many repetitions are going to be needed to meet that criteria. To address this need, Kotlin includes the *while* loop.

Essentially, the while loop repeats a set of tasks while a specified condition is met. The *while* loop syntax is defined as follows:

```
while condition {  
    // Kotlin statements go here  
}
```

In the above syntax, *condition* is an expression that will return either *true* or *false* and the *// Kotlin statements go here* comment represents the code to be executed while the condition expression is true. For example:

```
var myCount = 0
```

```
while (myCount < 100) {
```

```

    myCount++
    println(myCount)
}

```

In the above example, the `while` expression will evaluate whether the `myCount` variable is less than 100. If it is already greater than 100, the code in the braces is skipped and the loop exits without performing any tasks.

If, on the other hand, `myCount` is not greater than 100 the code in the braces is executed and the loop returns to the `while` statement and repeats the evaluation of `myCount`. This process repeats until the value of `myCount` is greater than 100, at which point the loop exits.

#### 14.1.3 The `do ... while` loop

It is often helpful to think of the `do ... while` loop as an inverted while loop. The `while` loop evaluates an expression before executing the code contained in the body of the loop. If the expression evaluates to `false` on the first check then the code is not executed. The `do ... while` loop, on the other hand, is provided for situations where you know that the code contained in the body of the loop will *always* need to be executed at least once. For example, you may want to keep stepping through the items in an array until a specific item is found. You know that you have to at least check the first item in the array to have any hope of finding the entry you need. The syntax for the `do ... while` loop is as follows:

```

do {
    // Kotlin statements here
} while conditional expression

```

In the `do ... while` example below the loop will continue until the value of a variable named `i` equals 0:

```
var i = 10
```

```

do {
    i--
    println(i)
} while (i > 0)

```

#### 14.1.4 Breaking from Loops

Having created a loop, it is possible that under certain conditions you might want to break out of the loop before the completion criteria have been met (particularly if you have created an infinite loop). One such example might involve continually checking for activity on a network socket. Once activity has been detected it will most likely be necessary to break out of the monitoring loop and perform some other task.

For the purpose of breaking out of a loop, Kotlin provides the `break` statement which breaks out of the current loop and resumes execution at the code directly after the loop. For example:

```

var j = 10

for (i in 0..100)
{
    j += j

    if (j > 100) {
        break
    }
}

```

## Kotlin Flow Control

```
    println("j = $j")
}
```

In the above example the loop will continue to execute until the value of *j* exceeds 100 at which point the loop will exit and execution will continue with the next line of code after the loop.

### 14.1.5 The *continue* Statement

The *continue* statement causes all remaining code statements in a loop to be skipped, and execution to be returned to the top of the loop. In the following example, the `println` function is only called when the value of variable *i* is an even number:

```
var i = 1

while (i < 20) {
    i += 1

    if (i % 2 != 0) {
        continue
    }

    println("i = $i")
}
```

The *continue* statement in the above example will cause the `println` call to be skipped unless the value of *i* can be divided by 2 with no remainder. If the *continue* statement is triggered, execution will skip to the top of the while loop and the statements in the body of the loop will be repeated (until the value of *i* exceeds 19).

### 14.1.6 Break and Continue Labels

Kotlin expressions may be assigned a label by preceding the expression with a label name followed by the @ sign. This label may then be referenced when using break and continue statements to designate where execution is to resume. This is particularly useful when breaking out of nested loops. The following code contains a for loop nested within another for loop. The inner loop contains a break statement which is executed when the value of *j* reaches 10:

```
for (i in 1..100) {

    println("Outer loop i = $i")

    for (j in 1..100) {
        println("Inner loop j = $j")
        if (j == 10) break
    }
}
```

As currently implemented, the break statement will exit the inner for loop but execution will resume at the top of the outer for loop. Suppose, however, that the break statement is required to also exit the outer loop. This can be achieved by assigning a label to the outer loop and referencing that label with the break statement as follows:

```
outerloop@ for (i in 1..100) {
```

```

    println("Outer loop i = $i")

    for (j in 1..100) {

        println("Inner loop j = $j")

        if (j == 10) break@outerloop
    }
}

```

Now when the value assigned to variable `j` reaches 10 the `break` statement will break out of both loops and resume execution at the line of code immediately following the outer loop.

## 14.2 Conditional Flow Control

In the previous chapter we looked at how to use logical expressions in Kotlin to determine whether something is *true* or *false*. Since programming is largely an exercise in applying logic, much of the art of programming involves writing code that makes decisions based on one or more criteria. Such decisions define which code gets executed and, conversely, which code gets by-passed when the program is executing.

### 14.2.1 Using the *if* Expressions

The *if* expression is perhaps the most basic of flow control options available to the Kotlin programmer. Programmers who are familiar with C, Swift, C++ or Java will immediately be comfortable using Kotlin *if* statements, although there are some subtle differences.

The basic syntax of the Kotlin *if* expression is as follows:

```

if (boolean expression) {
    // Kotlin code to be performed when expression evaluates to true
}

```

Unlike some other programming languages, it is important to note that the braces are optional in Kotlin *if* only one line of code is associated with the *if* expression. In fact, in this scenario, the statement is often placed on the same line as the *if* expression.

Essentially if the *Boolean expression* evaluates to *true* then the code in the body of the statement is executed. If, on the other hand, the expression evaluates to *false* the code in the body of the statement is skipped.

For example, if a decision needs to be made depending on whether one value is greater than another, we would write code similar to the following:

```

val x = 10

if (x > 9) println("x is greater than 9!")

```

Clearly, `x` is indeed greater than 9 causing the message to appear in the console panel.

At this point it is important to notice that we have been referring to the *if* expression instead of the *if* statement. The reason for this is that unlike the *if* statement in other programming languages, the Kotlin *if* returns a result. This allows *if* constructs to be used within expressions. As an example, a typical *if* expression to identify the largest of two numbers and assign the result to a variable might read as follows:

```

if (x > y)
    largest = x
else

```

## Kotlin Flow Control

```
largest = y
```

The same result can be achieved using the *if* statement within an expression using the following syntax:

```
variable = if (condition) return_val_1 else return_val_2
```

The original example can, therefore be re-written as follows:

```
val largest = if (x > y) x else y
```

The technique is not limited to returning the values contained within the condition. The following example is also a valid use of *if* in an expression, in this case assigning a string value to the variable:

```
val largest = if (x > y) "x is greatest" else "y is greatest"  
println(largest)
```

For those familiar with programming languages such as Java, this feature allows code constructs similar to ternary statements to be implemented in Kotlin.

### 14.2.2 Using *if ... else ...* Expressions

The next variation of the *if* expression allows us to also specify some code to perform if the expression in the *if* expression evaluates to *false*. The syntax for this construct is as follows:

```
if (boolean expression) {  
    // Code to be executed if expression is true  
} else {  
    // Code to be executed if expression is false  
}
```

The braces are, once again, optional if only one line of code is to be executed.

Using the above syntax, we can now extend our previous example to display a different message if the comparison expression evaluates to be *false*:

```
val x = 10
```

```
if (x > 9) println("x is greater than 9!")  
else println("x is less than 9!")
```

In this case, the second `println` statement will execute if the value of `x` was less than 9.

### 14.2.3 Using *if ... else if ...* Expressions

So far we have looked at *if* statements which make decisions based on the result of a single logical expression. Sometimes it becomes necessary to make decisions based on a number of different criteria. For this purpose, we can use the *if ... else if ...* construct, an example of which is as follows:

```
var x = 9  
  
if (x == 10) println("x is 10")  
else if (x == 9) println("x is 9")  
else if (x == 8) println("x is 8")  
else println("x is less than 8")  
}
```

### 14.2.4 Using the *when* Statement

The Kotlin *when* statement provides a cleaner alternative to the *if ... else if ...* construct and uses the following syntax:

```
when (value) {  
    match1 -> // code to be executed on match  
    match2 -> // code to be executed on match  
    .  
    .  
    else -> // default code to executed if no match  
}
```

Using this syntax, the previous *if ... else if ...* construct can be rewritten to use the *when* statement:

```
when (x) {  
    10 -> println ("x is 10")  
    9 -> println("x is 9")  
    8 -> println("x is 8")  
    else -> println("x is less than 8")  
}
```

The *when* statement is similar to the *switch* statement found in many other programming languages.

## 14.3 Summary

The term *flow control* is used to describe the logic that dictates the execution path that is taken through the source code of an application as it runs. This chapter has looked at the two types of flow control provided by Kotlin (looping and conditional) and explored the various Kotlin constructs that are available to implement both forms of flow control logic.
